House of the Seven Gables, The.—A romance by Nathaniel Hawthorne, published in 1851. "In *The House of the Seven Gables*," says R. H. Hutton, "we have a picture studied to impress on us that both personal character and the malign influences of evil action are transmitted, sometimes with accumulating force, even through centuries, blighting every generation through which they pass. The subject would apparently involve a series of sketches, but only two are introduced from the past, and the family characteristics are so anxiously preserved as to make even these seem like slight modifications of some of the living group. The only incident in the tale is the light thrown upon a crime—which had been committed thirty years before the story opens—by the sudden death of the principal representative of a family from the same disease, in the same chair, and under the same circumstances, as those of the old ancestor and founder of the family, whose picture hangs above the chair."

Hubbard, Old Mother.—A well-known nursery rhyme. *Mother Hubbard's Tale*, by Edmund Spenser, is a satirical fable in the style of Chaucer.

Hubert de Burgh (*bŏrg*, or *berg*).—Justice of England, created Earl of Kent, introduced by Shakespeare into *King John*. He is the one to whom the young prince addresses his piteous plea for life. The lad was found dead soon afterward, either by accident or foul play.

Hubert, Saint.—The legend of Saint Hubert makes him a patron saint of huntsmen.

Hudibras (*hū'di-bras*).—The title and hero of a celebrated satirical poem by Samuel Butler. Hudibras is a Presbyterian justice of the time of the commonwealth.

Hugh of Lincoln.—A legendary personage who forms the subject of Chaucer's *Prioress' Tale*, and also of an ancient English ballad. Wordsworth has given a modernized version of this tale.

Hugo Hugonet.—*Castle Dangerous*, Scott. Minstrel of the earl of Douglas.

Humphrey.—The imaginary collector of the tales in *Master Humphrey's Clock*, by Charles Dickens.

Humpty Dumpty.—The hero of a well-known nursery rhyme. The name signifies humped and dumpy, and is the riddle for an egg.

Huon de Bordeaux (*ü-ôn'de bor-dō'*).—A hero of one of the romances of chivalry bearing this name.

Hural Oyun.—In the fairy tales found in the Koran, these are the black-eyed daughters of paradise. They are created from muck, and are free from all physical weakness and are always young. It is held out to every male believer that he will have seventy-two of these girls as his household companions in paradise.

Hylas (*hī'las*).—A beautiful boy, beloved by Hercules, who was drawn into a spring by the enamored nymphs. The story has been treated by Bayard Taylor, and by William Morris in his *Life and Death of Jason*.

Hypatia (*hī-pā'shiā*).—A novel by the Rev. Charles Kingsley, the scene of which is laid in Alexandria, at a time when Christianity was gaining ground against Paganism and the neo-Platonism of the schools. Hypatia herself was born about the year 370, and, after attracting to her lectures on philosophy a large and brilliant auditory, was torn to pieces by the rabble of her native city in 415. *Hypatia* appeared in 1853.

Hyperion (*hī-pē'ri-on*, or *hī-per-ī'on*).—A romance in four books, by Henry Wadsworth Longfellow. This work, which was the result of an extensive tour in Germany, was published in 1839, and with much that is purely fanciful and imaginative, contains much that came within the actual experience of the author who is represented, idealized, in the character of Paul Flemming. The episode with Mary Ashburton is supposed to have reference to a real occurrence. The book is full of description and of eloquent discussion, besides being interspersed with snatches of legend and of song.

Hypocrites' Isle.—An island described by Rabelais in one of his satires. He pictures this island of *Hypocrites* as wholly inhabited by people of low and defiled natures, as, by sham saints, spiritual comedians, seducers, and "such-like sorry rogues who live on the alms of passengers like the hermit of Lamont."

I

Iago (*ē-ä'gō*).—*Othello*, Shakespeare. Othello's ensign and the villain of the play. Iago is said to be a character next to a devil, yet not quite a devil, which Shakespeare alone could execute without scandal.

Idleness, The Lake of.—*Faërie Queene*, Spenser. Whoever drank thereof grew instantly "faint and weary." The Red Cross Knight drank of it, and was readily made captive by Orgoglio.

Idylls of the King.—A series of poems by Tennyson. Taken together they form a parable of the life of man. Each idyll taken as a separate picture represents the war between sense and soul. In *Lancelot and Guinevere* the lower nature leads them astray and there is intense struggle before the higher nature prevails. In *Vivien*, *Tristram*, and *Modred*, the base and sensual triumph. In *Arthur*, *Sir Galahad* and *Percivale*, it is the victory of the spiritual.

Ignaro.—*Faërie Queene*, Spenser. Fosterfather of Orgoglio. Spenser says this old man walks one way and looks another, because ignorance is always "wrong-headed."

Iliad (*il'ē-ad*).—A famous Greek epic poem by Homer. It is the tale of the siege of Troy, in twenty-four books. It is written in Greek hexameters, and commemorates the deeds of Achilles and other Greek heroes at the siege of Troy. Books one, two and three are introductory to the war. Paris proposes to decide the contest by a single combat, and Menelaus accepts the challenge. Paris, being overthrown, is carried off by Venus, and Agamemnon demands that the Trojans shall give up Troy in fulfillment of the compact, and the siege follows. The gods take part, and frightful slaughter ensues. At length Achilles slays Hector, and the battle is at an end. Old Priam, going to the tent of Achilles, craves the body of his son Hector; Achilles gives it up, and the poem concludes with the funeral rites of the Trojan hero. Vergil continues the tale from this point, shows how the city was taken and burnt, and then continues with the adventures of Æneas, who escapes from the burning city, and makes his way to Italy.

Imogen (*im'ō-jen*).—The wife of Posthumus, and the daughter of Cymbeline in the play of Shakespeare's under title *Cymbeline*. "Of all Shakespeare's women," says Hazlitt, "she is, perhaps, the most tender and the most artless."

Incantation.—Is derived from a Latin root meaning simply "to sing." It is the term in use to denote one of the most powerful and awe-inspiring modes of magic, resting on a belief in the mysterious power of words solemnly conceived and passionately uttered.

Inchcape Rock.—It is dangerous for navigators, and therefore the abbot of Aberbrothock fixed a bell on a float, which gave notice to sailors. Southey says that Ralph the Rover, in a mischievous joke, cut the bell from the buoy, and it fell into the sea; but on his

return voyage his boat ran on the rock, and Ralph was drowned. Precisely the same tale is told of St. Goven's bell.

Inferno, The.—*Divine Comedy*, Dante. Epic peom in thirty-four cantos. Inferno is the place of the souls who are wholly given up to sin. The ascent is through Purgatory to Paradise.

Ingoldsby Legends (*ing'gōldz-bi lej'endz*, or *lē'jendz*).—A collection of legends in prose and verse, supposed to have been found in the family chest of the Ingoldsby family, and related by Thomas Ingoldsby. Of the poetical pieces it is not too much to say that, for originality of design and diction, for quaint illustration and musical verse, they are not surpassed in the English language. From the days of Hudibras to our time, the drollery invested in rhyme has never been so amply or so felicitously exemplified; and if derision has been unsparingly applied, it has been to lash knavery and imposture.

In Memoriam.—A poem by Alfred Tennyson, published in 1850, and consisting of one hundred and thirty "short swallow flights of song," in a measure which Tennyson has made his own. It is well known that these "brief lays, of sorrow born," were written in memory of the author's friend, Arthur Henry Hallam, who died in 1833. They are characterized by George MacDonald as forming "the poem of the hoping doubters, the poem of our age—the grand minor organ fugue of *In Memoriam*. It is the cry of the bereaved Psyche into the dark infinite after the vanished love. His friend is nowhere in his sight, and God is silent. Death, God's final compulsion to prayer, in its dread, its gloom, its utter stillness, its apparent nothingness, urges the cry. Moanings over the dead are mingled with the profoundest questionings of philosophy, the signs of nature, and the story of Jesus, while now and then the star of the morning, bright Phosphor, flashes a few rays through the shifting cloudy dark. And if the sun has not arisen on the close of the book, yet the aurora of the coming dawn gives light enough to make the onward journey possible and hopeful."

Innocents Abroad.—By Mark Twain. Travelers seeing Europe without any illusions. The fun consists in an irreverent application of modern common sense to historic associations, ridiculing sentimental humbug. An air of innocence and surprise adds to the drolleries of their adventures.

Instauratio Magna (*in-stâ-rā'shi-ō mag'nā*).—The title (*The Great Restoration*) which Bacon gave to his *Magnum Opus*, the design of which was for six divisions:—(1) *The Advancement of Learning;* (2) the *Novum Organum;* (3) the *Experimental History of Nature;* (4) the *Scala Intellectus*, which leads from experience to science; (5) the *Bodronic*, or anticipations of the second philosophy; and (6) *Active Science*, or experiment. Of these, only the first two, and a portion of the third (*Sylva Sylvarum*), were published. The idea that was to run through the *Instauratio* was that invention must be based upon experience, and experience upon experiment.

Interludes, The.—Springing from the moralities and bearing some resemblance to them, though nearer the regular drama, are the interludes, a class of compositions in dialogue, much shorter and more merry and farcical. They were generally played in the intervals of a festival.

Invocation.—An address at the commencement of a poem, in which the author calls for the aid of some divinity, particularly of his muse.

Iphigenia (*if"i-jē-nī'ă*).—The heroine of Euripides' tragedy *Iphigenia in Aulis*, and of Geothe's tragedy *Iphigenia auf Tauris*. She was placed on the altar in a rash vow by her father. Artemis at the last moment snatched her from the altar and carried her to heaven, substituting a hind in her place. The similarity of this legend to the scripture stories of Jephthah's vow and Abraham's offering of his son Isaac is noticeable.

Iras.—A strongly delineated charactedin *Ben Hur, a Tale of The Christ*, by Lew Wallace.

Iras.—A female attendant on Cleopatra in Shakespeare's play, *Antony and Cleopatra*.

Isaac of York.—A wealthy Jew, the father of Rebecca, in Sir Walter Scott's novel, *Ivanhoe*.

Isabella.—The heroine in Shakespeare's comedy, *Measure for Measure*.

Island of Lanterns.—In the celebrated satire of Rabelais, an imaginary country inhabited by false pretenders to knowledge. The name was probably suggested by the *City of Lanterns*, in the Greek romance of Lucian. Swift has copied this same idea in his *Island of Laputa*.

Island of St. Brandan.—A marvelous flying island, the subject of an old and widely spread legend of the middle ages. Though the island of St. Brandan has been a disappointment to voyagers, it has been a favorite theme with poets.

Island of the Blest.—Imaginary island in the west. Hither the favorites of the gods were conveyed without dying, and dwelt in never-ending joy. The name first occurs in Hesiod's *Works and Days*. This phrase is often used in modern literature.

Ithuriel (*i-thō'ri-el*).—In Milton's *Paradise Lost*, an angel commissioned by Gabriel to search through paradise, in company with Zephon, to find Satan, who had eluded the vigilance of the angelic guard, and effected an entrance into the garden. It is related that Ithuriel found Satan "squat like a toad, close at the ear of Eve," and transformed him by a touch of his spear into his proper shape.

Ivanhoe.—A novel by Sir Walter Scott. The hero, also Ivanhoe, figures as Cedric of Rotherwood's disinherited son, the favorite of King Richard I., and the lover of the Lady Rowena, whom, in the end, he marries. The scene is laid in England in the reign of Richard I., and we are introduced to Robin Hood in Sherwood forest, banquets in Saxon halls, tournaments, and all the pomp of ancient chivalry. Rowena, the heroine, is quite thrown into the shade by the gentle, meek, yet high-souled Rebecca.

Ivory Gate of Dreams.—Dreams which delude pass through the ivory gate, but those which come true through the horn gate.

J

Jack and the Bean-Stalk.—A nursery legend said to be an allegory of the Teutonic *Al-fader*, the "red hen" representing the all-producing sun, the "money-bags" the fertilizing rain, and the "harp" the winds.

Jack-in-the-Green.—A prominent character in Maypole dances.

Jack Robinson.—A famous comic song by Hudson.

Jack Sprat.—The hero of a nursery rhyme. Jack and his wife form a fine combination in domestic economy.

Jack the Giant-killer.—The name of a famous hero in the literature of the nursery, the subject of one of the Teutonic or Indo-European legends, which have become nationalized in England and America.

Jaquenetta (*jak-e-net'ă*).—*Love's Labor's Lost*, Shakespeare. A country wench courted by Don Adriano de Armado.

Jaques (*zhā'kes*).—A lord attending upon the exiled duke, in Shakespeare's *As You Like It*. A contemplative character who thinks and does—nothing. He is called the "melancholy Jaques," and affects a cynical philosophy. He could "suck melancholy out of a song, as a weasel sucks eggs."

Jarley, Mrs.—The proprietor of a waxwork show in Dickens' *Old Curiosity Shop*. She has lent her name to a popular game of parlor tableaux.

Jarndyce (*järn'dis*), **John.**—A prominent figure in Dickens' *Bleak House*, distinguished for his philanthropy, easy good-nature and good sense, and for always saying, "The wind is in the east," when anything went wrong with him. The famous suit of Jarndyce *vs.* Jarndyce, in this novel, is a satire upon the court of chancery.

Jarvie, Nicol.—A prominent character in Sir Walter Scott's novel *Rob Roy*. He is a bailie of Glasgow.

Javert (*zhă-var'*).—An officer of the police force in *Les Misérables*, by Victor Hugo. He is the incarnation of inexorable law.

Jarvis.—A faithful old servant, in Moore's *The Gamester*, who tries to save his master, Beverley, from his fatal passion of gambling.

Jaup.—An old woman at Middlemas village, in Scott's *The Surgeon's Daughter*.

Jekyll, Doctor, and Mr. Hyde.—A singular romance by Robert Louis Stevenson. The hero is a duplex character—Dr. Jekyll and Mr. Hyde. Doctor Jekyll is a benevolent and upright physician, who by means of a potion is able to transform himself for a time into a second personality, Mr. Hyde, of a brutal and animal nature.

Jellyby (*jel'i-bi*), **Mrs.**—A character in Dickens' novel, *Bleak House*, a type of sham philanthropy. She spends her time and energy on foreign missions to the neglect of her family. Mrs. Jellyby is quite overwhelmed with business correspondence relative to the affairs of Borrioboola Gha.

Jenkins, Winifred.—The name of Miss Tabitha Bramble's maid in Smollett's *Expedition of Humphrey Clinker*. She makes ridiculous blunders in speaking and writing.

Jenkinson, Ephraim.—A green old swindler, whom Dr. Primrose met in a public tavern. Dr. Primrose sold the swindler his horse, Old Blackberry, for a draft upon Farmer Flamborough.

Jereboam (*jer-ō-bō'am*) **Sermon.**—One of Dr. Emmons' sermons, which made a great noise at the time. It was known as his Jeroboam Sermon. It was written on the occasion of Jefferson's inauguration as president, and, although Jefferson is not named, the delineation of the character of Jeroboam is such that no one can doubt the personal application intended.

Jerusalem Delivered.—An epic in twenty books, by Torquato Tasso. The crusaders, encamped on the plains of Tortosa, chose Godfrey for their chief, and Alandine, king of Jerusalem, made preparations for defense. The Christian army having reached Jerusalem, the king of Damascus sent Armida to beguile the Christians. It was found that Jerusalem could never be taken without the aid of Rinaldo. Godfrey, being informed that the hero was dallying with Armida in the enchanted island, sent to invite him back to the army: he returned, and Jerusalem was taken. Armida fled into Egypt, and offered to marry any knight who slew Rinaldo. The love of Rinaldo returned, he pursued her and she relented. The poem concludes with the triumphant entry of the Christian army into the Holy City, and their devotions at the tomb of the Redeemer. The two chief episodes are the loves of Olindo and Sofronia, and of Tancred and Clorinda.

Jessica (*jes'i-kă*).—The beautiful daughter of Shylock, in Shakespeare's *Merchant of Venice*.

Jones, Tom.—The hero of Fielding's novel entitled *The History of a Foundling*, represented as a model of generosity, openness, and manly spirit, though thoughtless and dissipated.

Joyeuse (*zhwä-yez'*).—The sword of Charlemagne as mentioned in romances of chivalry.

Joyeuse Garde (*zhwä-yez'gärd*).—The residence of the famous Lancelot du Lac.

Judith.—The heroine in the book by the same name in the Apocrypha. She was a beautiful Jewess of Bethulia, who, when her town was besieged by Holofernes, the general of Nebuchadnezzar, attended him in his tent, and, when he was drunk, killed him, whereupon her townsmen fell upon the Assyrians and defeated them with great slaughter. The tale is not mentioned by Josephus, and has, from an early period, been held to be an allegory. It has frequently furnished poets and painters with subjects.

Julius Cæsar.—An historical tragedy by William Shakespeare. The poet was in this, as in other plays, materially assisted by North's translation of Plutarch. "Shakespeare's *Julius Cæsar*," says Hazlitt, "is not equal, as a whole, to either of his other plays taken from the Roman history. It is inferior in interest to *Coriolanus*, and both in interest and power to *Antony and Cleopatra*. It, however, abounds in admirable and affecting passages, and is remarkable for the profound knowledge of character, in which Shakespeare could hardly fail."

K

Kadr, Al.—The night on which the *Koran* was sent down to Mohammed. Al Kadir is supposed to be the seventh of the last ten nights of Ramadan, or the night between the twenty-third and twenty-fourth days of the month.

Kay.—A foster brother of King Arthur, and a rude and boastful knight of the Round Table. He was the butt of King Arthur's court. Called also Sir Queux. He appears in the *Boy and the Mantle*, in Percy's *Reliques*. Sir Kay is represented as the type of rude boastfulness, Sir Gawain of courtesy, Sir Launcelot of chivalry, Sir Mordred of treachery, Sir Galahad of chastity, Sir Mark of cowardice.

Kehama (*kē-hä'mă*).—A Hindu rajah who obtains and sports with supernatural power. His adventures are related in Southey's poem entitled *The Curse of Kehama*.

Kenilworth.—A novel by Sir Walter Scott. This is very superior to *The Abbot* and *The Monastery*. For interest it comes next to *Ivanhoe*, and the portrait of Queen Elizabeth is lifelike and correct. That of Queen Mary is given in *The Abbot*. Full of courtly gayeties and splendor, the novel contains the unhappy tale of the beautiful Amy Robsart, which cannot fail to excite our sympathy and pity.

Kent, Earl of.—A rough, plain-spoken, but faithful nobleman in Shakespeare's *King Lear*, who follows the fallen fortunes of the king, disguised as a servant, under the assumed name of Caius.

Kenwigs (*ken'wigz*).—A family in Dickens' novel *Nicholas Nickleby*, including a number of little girls who differed from one another only in the length of their frilled pantalets and of their flaxen pigtails tied with bows of blue ribbon.

Kilkenny Cats.—Two cats, in an Irish story, which fought till nothing was left but their tails. It is probably a parable of a local contest between Kilkenny and Irishtown, which impoverished both boroughs.

Kilmansegg, Miss.—An heiress with great expectations and an artificial leg of solid gold, in Hood's poem, *A Golden Legend*.

King Horn.—A metrical romance which was very popular in the thirteenth century. King Horn is a beautiful young prince who is carried away by pirates; but his life is spared, and after many wonderful adventures he weds a princess, and regains his father's kingdom.

King Lear.—A tragedy by Shakespeare whose hero is a fabulous or legendary king of Britain. He had three daughters, and when four score years old, wishing to retire from the active duties of sovereignty, resolved to divide his kingdom between them, but was persuaded to disinherit Cordelia. The beauty of the play is the exquisite character of Cordelia, who is a "perfect woman."

King Log and King Stork.—Characters in a celebrated fable of Æsop, which relates that the frogs, grown weary of living without a government, petitioned Jupiter for a king. Jupiter accordingly threw down a log among them, which made a satisfactory ruler till the frogs recovered from their fright and discovered his real nature. They, therefore, entreated Jupiter for another king, whereupon he sent them a stork, who immediately began to devour them.

Klaus, Peter.—The hero of an old popular tradition of Germany—the prototype of Rip Van Winkle—represented as a goatherd.

Knickerbocker, Diedrich.—The imaginary author of a humorous fictitious *History of New York*, written by Washington Irving.

Knight of the Swan.—Lohengrin, son of Parsival, because his boat was drawn by a swan.

Knights of the Round Table.—King Arthur's knights were so called because they sat with him at a round table made by Merlin for King Leodogran. This king gave it to Arthur on his marriage with Guinevere, his daughter.

Koppenberg.—The mountain of Westphalia to which the pied piper (Bunting) led the children, when the people of Hamelin refused to pay him for killing their rats. Browning's poem, *The Pied Piper*, tells the tale.

L

Lady of Lyons, The.—A drama, by Lord Lytton, in which Pauline Deschappelles, daughter of a Lyonese merchant, rejects the suits of Beauseant, Glavis, and Claude Melnotte, who therefore combined. Claude, who was a gardener's son, aided by the other two, passed himself off as Prince Como, married Pauline, and brought her home to his mother's cottage. The proud beauty was very indignant, and Claude left her to join the French army. He became a colonel, and returned to Lyons. He found his father-in-law on the eve of bankruptcy, and that Beauseant had promised to satisfy the creditors if Pauline would consent to marry him. Pauline was heartbroken; Claude revealed himself, paid the money required, and carried home the bride.

Lady of Shalott, The.—A poem by Alfred Tennyson, founded on an incident in *King Arthur*. It is descriptive of "a being whose existence passes without emotion, without changes, without intelligible motive for living on, without hope or fear, here or hereafter."

Lady of the Lake, The.—A poem in six cantos by Sir Walter Scott, published in 1810. "Measured even by the standard of the *Minstrel* and *Marmion*, the *Lady of the Lake* possessed," says Palgrave, "merits of its own, which raised his reputation still higher. Jeffrey's prediction has been perfectly fulfilled, that the *Lady of the Lake* would be 'oftener read than either of the former,' and it is generally acknowledged to be, in Lockhart's words, 'the most interesting, romantic, picturesque, and graceful of his great poems.'" The descriptions of scenery, which form one of the chief charms of the poem, render it, even now, one of the most minute and faithful handbooks to the region in which the drama of Ellen and the Knight of Snowdon is laid.

Lake Poets, The.—Wordsworth, Southey, and Coleridge, who lived about the lakes of Cumberland.

Lalla Rookh (*lal'ă rŏk*).—An oriental romance by Thomas Moore, consisting of four tales in verse, entitled *The Veiled Prophet of Khorassan*, *Paradise and the Peri*, *The Fire-Worshipers*, and *The Light of the Harem*, and connected by a short prose narrative, in which it is described how Lalla Rookh, daughter of the Emperor Aurungzebe, journeys toward Bucharia to

meet her engaged husband, and how the prince gains her love on the way, in the guise of a Cashmerian minstrel. *Lalla Rookh* was published in 1817.

L'Allegro (*lăl-lā'grō*).—A descriptive poem by John Milton, probably written during his college life.

L'Amour Médecin (*la-mōōr' mād-saN'*) (or, *The Love Doctor*).—A comedy by Molière, written about the year 1665. Lucinde, the daughter of Sganarelle, is in love, and the father calls in four doctors to consult upon the nature of her malady. They see the patient, and retire to consult together, but talk about Paris, about their visits, about the topics of the day; and when the father enters to know what opinion they have formed, they all prescribe different remedies, and pronounce different opinions. Lisette then calls in a "quack" doctor (Clitandre, the lover), who says he must act on the imagination, and proposes a seeming marriage, to which Sganarelle assents. The assistant being a notary, Clitandre and Lucinde are married.

Lampoon.—A personal satire, often bitter and malignant. These libels, carried to excess in the reign of Charles II., acquired the name of lampoons from the burden sung to them: "*Lampone, lampone, camerada lampone.*"

Land of Beulah.—The paradise in which souls wait before the resurrection. In *Pilgrim's Progress* the land from which the pilgrims enter the Celestial City. The name is found in Isaiah lxii., 4.

Land of Bondage.—Name given to Egypt in the Bible.

Land of Cakes.—A name sometimes given to Scotland, because oatmeal cakes are a common national article of food, particularly among the poorer classes.

Land of Nod.—In common speech sleepy-land or land of dreams.

Land of Promise.—The land promised to Abraham—Canaan.

Land of Shadows.—A place of unreality, sometimes meaning land of ghosts.

Land o' the Leal.—An unknown land of happiness, loyalty, and virtue. Caroline Oliphant, baroness Nairne, meant heaven in her song and this is now its accepted meaning.

Land of Wisdom.—A name given to Normandy, in France, because of the wise customs which have prevailed there, and also because of the skill and judgment of the people in making laws.

Land of Veda (*vē'dā*).—Name often given to India.

Landlady's Daughter.—She rowed Flemming "over the Rhine-stream, rapid and roaring wide," and told to him the story of the *Liebenstein*.

Last Days of Pompeii (*pom-pā'yē*), **The.**—A novel by Bulwer Lytton, Edward George, Baron Lytton, which was published in 1834. The interest of the book is one of situation and of action rather than of character. The scenes which linger on our memories longest are the noonday excursion on the Campanian seas, the temple of Isis, with its hidden machinery; the funeral pomp and dirge of the murdered Apæcides, Lydon perishing in the unequal struggle; the price which was to have been paid for a father's liberty; and lastly, the grand catastrophe, a subject which called forth all Lord Lytton's brilliant powers.

Last of the Mohicans.—The Indian chief Uncas is so called by Cooper in his novel of that title.

Launfal (*lăn'fal*), **Sir.**—Steward of King Arthur. James Russell Lowell has a poem entitled *The Vision of Sir Launfal*.

Lavaine.—Son of the lord of Astolat, who accompanied Sir Lancelot when he went to tilt for the ninth diamond. Lavaine is described as young, brave, and a true knight. He was brother to Elaine.

Lavinia (*la-vin'i-ă*) **and Palemon.**—Lavinia was the daughter of Acasto, patron of Palemon. Through Acasto Palemon gained a fortune and wandered away from his friend. Acasto lost his property, and dying, left a widow and daughter in poverty. Palemon often sought them, but could never find them. One day, a lovely modest maiden came to glean in Palemon's fields. The young squire was greatly struck with her exceeding beauty and modesty, but she was known as a pauper and he dared not give her more than a passing glance. Upon inquiry he found that the beautiful gleaner was the daughter of Acasto; he proposed marriage, and Lavinia was restored to her rightful place.

Leonato (*lē-ō-nä'tō*).—Governor of Missina in Shakespeare's *Much Ado About Nothing*. He prematurely accredited the accusations against his daughter, Hero.

Leonine (*lē'ō-nīn*).—In Shakespeare's *Pericles*. Servant to Dionyza. The latter conspired with him to murder Marina, and was saved from the crime only by the intervention of pirates.

Léonore (*lā-ō-nōr'*).—In Molière's *L'ecole des Maris*, sister of Isabelle, an orphan; brought up by Ariste according to his notions of training a girl to make him a good wife. He put her on her honor, tried to win her confidence and love, gave her all the liberty consistent with propriety and social etiquette, and found that she loved him, and made a fond and faithful wife.

Leviathan (*lē-vi'a-than*) (or, the *Matter, Form, and Power of a Commonwealth, Ecclesiastical and Civil*).—A work by Thomas Hobbes, published in 1651. In *Leviathan*, Hobbes' peculiar theories in politics received their fullest and ablest expression. They found an illustrious opponent in Lord Clarendon, who, in 1676, published *A Brief View and Survey of the Dangerous and Pernicious Errors to Church and State in Mr. Hobbes' book Entitled Leviathan*.

Little Dorrit.—The heroine and title of a novel by Charles Dickens. Little Dorrit was born and brought up in the Marshalsea prison, Bermondsey, where her father was confined for debt; and when about fourteen years of age she used to do needlework, to earn a subsistence for herself and her father. The child had a pale, transparent face; was quick in expression, though not beautiful in feature. Her eyes were a soft hazel, and her figure slight. The little dove of the prison was idolized by the prisoners, and when she walked out, every man in Bermondsey who passed her, touched or took off his hat out of respect to her good works and active benevolence. Her father, coming into a property, was set free at length, and Little Dorrit married Arthur Clennam, the marriage service being celebrated in the Marshalsea, by the prison chaplain.

Little John.—A big, stalwart fellow, named John Little, who encountered Robin Hood, and gave him a sound thrashing, after which he was rechristened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The Talisman*.

Little Nell.—*Old Curiosity Shop*, Dickens. The prominent character of the story, pure and true, though living in the midst of selfishness and crime. She was brought up by her grandfather, who was in his dotage, and who tried to eke out a narrow living by selling curiosities. At length, through terror of Quilp, the old man and his grandchild stole away, and led a vagrant life.

Lochinvar (*lock'in-var*).—A young highlander, in the poem of *Marmion*, was much in love with a lady whose fate was decreed that she should marry a "laggard." Young Lochinvar persuaded the too-willing lassie to be his partner in a dance; and, while the guests were intent on their amusements, swung her into his saddle and made off with her before the bridegroom could recover from his amazement.

Locksley.—So Robin Hood is sometimes called, from the village in which he was born.

Locksley Hall.—A poem by Tennyson, in which the hero, the lord of Locksley Hall, having been jilted by his cousin Amy for a rich boor, pours forth his feelings in a flood of scorn and indignation. The poem is understood to have been occasioned by a similar incident in the poet's own life, but this has been questioned.

Lohengrin (*lō'hen-grin*).—The Knight of the Swan; the hero of a romance by Wolfram von Eschenbach, a German minnesinger of the thirteenth century, and also of a modern musical drama by Richard Wagner. He was the son of Parsival, and came to Brabant in a ship drawn by a white swan, which took him away again when his bride, disobeying his injunction, pressed him to discover his name and parentage.

Lorelei, or **Loreley** (*lō're-lī*).—In German poetry and romance, a siren supposed to haunt the Lurlenberg rock on the Rhine, and lure sailors and fisherman to destruction. She is the subject of a beautiful ballad by Heine.

Lorna Doone.—A novel by R. D. Blackmore, published in 1869, the scene of which is laid in Exmoor. The Doones are a family of robbers and freebooters from which Lorna, otherwise Lady Lorna Dugal, is rescued by John Ridd, a young man. Ridd finally broke up the band, drove them from Doone valley, and married Lorna.

Love's Labor's Lost.—A comedy by Shakespeare. Ferdinand, king of Navarre, with three lords named Biron, Dumain, and Longaville, agree to spend three years in study, during which time no woman was to approach the court. The compact signed, all went well until the princess of France, attended by Rosaline, Maria, and Katharine, besought an interview respecting certain debts said to be due from the king of France to the king of Navarre. The four gentleman fell in love with the four ladies. The love of the king sought the princess, by right, Biron loved Rosaline, Longaville admired Maria, and Dumain adored Katharine. In order to carry their suits, the four gentlemen, disguised as Muscovites, presented themselves before the ladies; but the ladies, being warned of the masquerade,

disguised themselves also, so that the gentlemen in every case addressed the wrong lady. A mutual arrangement was made that the suits should be deferred for twelve months and a day; and if, at the expiration of that time, they remained of the same mind, the matter should be taken into serious consideration.

Lusiad (*lū'si-ad*), **The.**—A Portuguese poem by Luiz Camoëns, in 1572. *The Lusiad* celebrates the chief events in the history of Portugal, and is remarkable as the only modern epic poem which is pervaded by anything approaching the national and popular spirit of ancient epic poems. Bacchus was the guardian power of the Mohammedans, and Venus, or Divine Love, of the Lusians. The fleet first sailed to Mozambique, then to Melinda (in Africa), where the adventurers were hospitably received and provided with a pilot to conduct them to India. In the Indian Ocean, Bacchus tried to destroy the fleet; Venus, however, calmed the sea, and Gama arrived in India in safety. Having accomplished his object, he returned to Lisbon. Among the most famous passages are the tragical story of Inez de Castro, and the apparition of the giant Adamastor, who appears as the spirit of the storm to Vasco da Gama, when crossing the cape. The versification of *The Lusiad* is extremely charming.

M

Mab.—The queen of the fairies, famous in English literature if only on account of the exquisite description of her put into the mouth of Mercutio, in *Romeo and Juliet*, beginning "O, then, I see Queen Mab hath been with you."

Macbeth.—One of Shakespeare's most celebrated tragedies, whose chief characters are Macbeth, king of Scotland, and Lady Macbeth, his murderously ambitious wife. Urged by the latter he kills Duncan, the rightful king, and in turn is himself slain by Macduff. The tale of Macbeth and Banquo was borrowed from the legendary history of Scotland, but the interest of the play is not historical. It is a tragedy of human life, intensely real, the soul, with all its powers for good or evil, deliberately choosing evil. The three witches in the desert place, in thunder, lightning, storm, strike the keynote of evil suggestion. The awfulness of soul destruction is felt in Macbeth and Lady Macbeth as in no other of Shakespeare's dramas.

Macheath, Captain.—A highwayman who is the hero of Gay's *Beggar's Opera.*

Mac-Ivor (*mak-ē'vor*), **Fergus.**—*Waverley*, Scott, Fergus Mac-Ivor is a prominent character in the novel, and his sister, Flora Mac-Ivor, the heroine. They are of the family of a Scottish chieftain.

Macreons, The Island of.—*Pantagruel*, Rabelais. The title is given to Great Britain, derived from a Greek word meaning long-lived, "because no one is put to death there for his religious opinions." Rabelais says the island "is full of antique ruins and relics of popery and ancient superstitions."

Madasima, Queen.—An important character in the old romance called *Amadis de Gaul;* her constant attendant was Elisabat, a famous surgeon with whom she roamed in solitary retreats.

Madoc (*mad'ok*).—A poem by Southey, founded on one of the legends connected with the early history of America. Madoc, a Welsh prince of the twelfth century, is represented as making the discovery of the western world. His contests with the Mexicans form the subject.

Maidens' Castle.—An allegorical castle mentioned in Malory's *History of Prince Arthur.* It was taken from a duke by seven knights, and held by them till Sir Galahad expelled them. It was called The Maidens' Castle because these knights made a vow that every maiden who passed it should be made a captive.

Maid Marian.—A half mythical character, but the name is said to have been assumed by Matilda, daughter of Robert, Lord Fitzwalter, while Robin Hood remained in a state of outlawry. The name is considered the foundation of the word marionettes, from Maid Marian's connection with the morris dance, or May-day dance, at which she was said to appear.

Maid of Athens.—Made famous by Lord Byron's song of this title. Twenty-four years after this song was written an Englishman sought out "the Athenian maid," and found a beggar without a vestige of beauty.

Maid of Saragossa.—*Childe Harold*, Byron. A young Spanish woman distinguished for her heroism during the defense of Saragossa in 1808-1809. She first attracted notice by mounting a battery where her lover had fallen, and working a gun in his place.

Malade Imaginaire, Le (or, *The Imaginary Invalid*).—A comedy by Molière. Mons. Argan, who took seven mixtures and twelve lavements in one month instead of twelve mixtures with twenty lavements, as he had hitherto done. "No wonder," he says, "I am not so well." He fancies his wife loves him dearly, and that his daughter is undutiful, because she declines to marry a young medical prig instead of Cleante, whom she loves. His brother persuades "the malade" to counterfeit death, in order to test the sincerity of his wife and daughter. The wife rejoices greatly at his death, and proceeds to filch his property, when Argan starts up and puts an end to her pillage. Next comes the daughter's turn. When she hears of her father's death, she bewails him with great grief, says she has lost her best friend, and that she will devote her whole life in prayer for the repose of his soul. Argan is delighted, starts up in a frenzy of joy, declares she is a darling, and shall marry the man of her choice freely, and receive a father's blessing.

Malaprop (*mal'a-prop*), **Mrs.**—A character in Sheridan's *Rivals*, noted for her blundering use of words.

Malbecco.—*Faërie Queene*, Spenser. The husband of a young wife, Helinore, and himself a crabbed, jealous old fellow.

Malengrin.—A character in Spenser's *Faërie Queene*, who carried a net on his back "to catch fools with." The name has grown to mean the personification of guile or flattery.

Malepardus.—The castle of Master Reynard, the Fox, in the beast epic of *Reynard the Fox.*

Malvoisin.—*Ivanhoe*, Scott. One of the challenging knights at the tournament (Sir Philip de Malvoisin). Sir Albert de Malvoisin was a preceptor of the Knights Templar.

Mambrino (*măm-brē'nō*).—*Poems*, Ariosto, etc. A king of the Moors, who was the possessor of an enchanted golden helmet, which rendered the wearer invulnerable and which was the object of eager quest to the paladins of Charlemagne. This helmet was borne away by the knight Rinaldo. In *Don Quixote* we are told of a barber who was caught in a shower of rain, and who, to protect his hat, clapped his brazen basin on his head. Don Quixote insisted that this basin was the helmet of the Moorish king; and, taking possession of it, wore it as such.

Managarm.—*Prose Edda.* The largest and most formidable of the race of giants. He dwells in the Ironwood, Jamvid. Managarm will first fill himself with the blood of man, and then he will swallow up the moon. This giant symbolizes war, and the iron wood in which he dwells is the wood of spears.

Manfred.—A poem by Byron. Manfred sold himself to the prince of darkness, and received from him seven spirits to do his bidding. They were the spirits of "earth, ocean, air, night, mountains, winds, and the star of his own destiny." Wholly without human sympathies, the count dwelt in splendid solitude among the Alpine mountains. He loved Astarte, and was visited by her spirit after her death. In spirit form she told Manfred that he would die the following day; and, when asked if she loved him, she signed "Manfred," and vanished.

Manon l'Escaut (*mā-non' les-kō*).—A French novel by A. F. Prévost. Manon is the "fair mischief" of the story. Her charms seduce and ruin the chevalier des Grieux, who marries her. After marriage, the selfish mistress becomes converted into the faithful wife, who follows her husband into disgrace and banishment, and dies by his side in the wilds of America. The object of this novel, like that of *La Dame aux Camélias*, by Dumas *fils*, is to show how true hearted, how self-sacrificing, how attractive, a *fille de joie* may be.

Mantalini (*man-ta-lē'nē*).—*Nicholas Nickleby*, Dickens. The husband of madame; he is a man doll, noted for his white teeth, his oaths, and his gorgeous morning gown. This "exquisite" lives on his wife's earnings, and thinks he confers a favor on her by spending. Madame Mantalini is represented as a fashionable dressmaker near Cavendish Square, London.

Marble Faun, The.—A romance by Hawthorne, published in 1860. The English edition, published in the same year, is called *Transformation, or the Romance of Monte Beni.* See *Donatello.* The sole idea of the *Marble Faun* is to illustrate the intellectually and morally awakening power of a sudden impulsive sin, committed by a simple, joyous, instinctive, "natural" man. The whole group of characters is imagined solely with a view to the development of this idea.

Marcellus (*mär-sel'us*).—*Hamlet*, Shakespeare. An officer of Denmark, to whom the ghost of the murdered king appeared before it presented itself to Prince Hamlet.

Marchioness, The.—*Old Curiosity Shop*, Dickens. A half-starved maid-of-all-work, in the service of Sampson Brass and his sister Sally. She was so lonesome

and dull that it afforded her relief to peep at Mr. Swiveller even through the keyhole of his door. Mr. Swiveller called her the "marchioness," when she played cards with him, "because it seemed more real and pleasant" to play with a marchioness than with a domestic. While enjoying these games they made the well known "orange peel wine."

Mariana (*mă-rē-ā'nă*).—In Tennyson's poem *The Moated Grange*, a young damsel, who sits in the moated grange, looking out for her lover, who never comes. (2) In Shakespeare's *Measure for Measure* Mariana is a lovely and lovable lady, betrothed to Angelo, who, during the absence of Vincentio, the duke of Vienna, acted as his lord deputy. Her pleadings to the duke for Angelo are wholly unrivaled.

Martin's Summer, St.—Halcyon days; a time of prosperity; fine weather. Mentioned by Shakespeare in *Henry VI.*, etc.

Masora.—A critical work or canon, whereby is fixed and ascertained the reading of the text of the Hebrew version of the Bible.

Mauth Dog.—*Lay of the Last Minstrel*, Scott. A black specter spaniel that haunted the guard room of Peeltown in the Isle of Man. A drunken trooper entered the guard room while the dog was there, but lost his speech, and died within three days.

Mazeppa (*mă-zep'ă*).—A poem by Byron. Mazeppa was a Cossack of noble family who became a page in the court of the king of Poland, and while in this capacity intrigued with Theresia, the young wife of a count, who discovered the amour, and had the young page lashed to a wild horse, and turned adrift.

McFingal.—The hero of Trumbull's political poem of the same name; represented as a burly New England squire, enlisted on the side of the Tory part of the American revolution, and constantly engaged in controversy with Honorius, the champion of the Whigs.

Measure for Measure.—A comedy by Shakespeare. There was a law in Vienna that made it death for a man to live with a woman not his wife; but the law was so little enforced that the mothers of Vienna complained to the duke of its neglect. So the duke deputed Angelo to enforce it; and, assuming the dress of a friar, absented himself awhile, to watch the result. Scarcely was the duke gone, when Claudio was sentenced to death for violating the law. His sister Isabel went to intercede on his behalf, and Angelo told her he would spare her brother if she would become his Phryne. Isabel told her brother he must prepare to die, as the conditions proposed by Angelo were out of the question. The duke, disguised as a friar, heard the whole story, and persuaded Isabel to "assent in words," but to send Mariana (the divorced wife of Angelo) to take her place. This was done; but Angelo sent the provost to behead Claudio, a crime which "the friar" contrived to avert. Next day the duke returned to the city, and Isabel told her tale. Finally the duke married Isabel, Angelo took back his wife, and Claudio married Juliet.

Medea (*mē-dē'ă*).—A play by Euripides. The *Medea* came out in 431 B. C. along with the poet's *Philoctetes*, *Dictys*, and the satiric *Reapers* (the last was early lost). It was based upon a play of Neophron's, and only obtained the third prize, Euphorion being first, and Sophocles second. It may accordingly be regarded as a failure in its day—an opinion apparently confirmed by the faults (viz., Ægeus and the winged chariot) selected from it as specimens in Aristotle's *Poetica*. There is considerable evidence of there being a second edition of the play, and many of the variants, or so-called interpolations, seem to arise from both versions being preserved and confused. Nevertheless, there was no play of Euripides more praised and imitated.

Médcine Malgré Lui, Le (*mād-saN' mal-grā'lwē lu*), (or, *The Doctor in Spite of Himself*).—A comedy by Molière. The "enforced doctor" is Sganarelle, a fagot maker, who is called in by Géronte to cure his daughter of dumbness. Sganarelle soon perceives that the malady is assumed in order to prevent a hateful marriage, and introduces her lover as an apothecary. The dumb spirit is at once exorcized, and the lovers made happy with "pills matrimonial."

In 1733 Fielding produced a farce called *The Mock Doctor*, which was based on this comedy. The doctor he calls "Gregory," and Geronte "Sir Jasper." Lucinde, the dumb girl, he calls "Charlotta;" and Angelicizes her lover's name, Léandre, into "Leander."

Meg Merrilies (*mer'i-lēz*).—A prominent character in Scott's *Guy Mannering*, a half-crazy gypsy or sibyl.

Meistersingers (*mīs'ter-sing-ers*).—In Germany an association of master tradesmen, to revive the national minstrelsy, which had fallen into decay with the decline of the minnesingers or love minstrels (1350-1523). Their subjects were chiefly moral or religious, and constructed according to rigid rules.

Melissa (*me-lis'ă*).—*Orlando Furioso*, Ariosto. The prophetess who lived in Merlin's cave. Bradamante gave her the enchanted ring to take to Rogero; so, assuming the form of Atlantes, she not only delivered Rogero but disenchanted all the forms metamorphosed in the island where he was captive.

Melnotte, Claude.—*Lady of Lyons*, Bulwer. The son of a gardener in love with Pauline, "the Beauty of Lyons," but treated by her with contempt. Beauseant and Glavis, two other rejected suitors, conspired with him to humble her.

Merchant of Venice.—A comedy by Shakespeare. Antonio the merchant, signs a bond in order to borrow money from Shylock, a Jew, for Bassanio, the lover of Portia. If the loan was repaid within three months, only the principal would be required; if not, the Jew should be at liberty to claim a pound of flesh from Antonio's body. The ships of Antonio being delayed by contrary winds, the merchant was unable to meet his bill, and the Jew claimed the forfeiture. Portia, in the dress of a law doctor, conducted the defense, and saved Antonio by reminding the Jew that a pound of flesh gave him no drop of blood.

Merlin.—The name of an ancient Welsh prophet and enchanter. He is often alluded to by the older poets, especially Spenser, in his *Faërie Queene*, and also figures in Tennyson's *Idylls of the King*. In the *History of Prince Arthur* by Malory, Merlin is the prince of enchanters and of a supernatural origin. He is said to have built the Round Table and to have brought from Ireland the stones of Stonehenge.

Merlin's Cave.—In Dynevor, near Carmarthen, noted for its ghastly noises of rattling iron chains, groans, and strokes of hammers. The cause is said to be this: Merlin set his spirits to fabricate a brazen wall to encompass the city of Carmarthen, and, as he had to call on the Lady of the Lake, bade them not slacken their labor till he returned; but he never did return, for Vivian held him prisoner by her wiles.

Merry Wives of Windsor, The.—A comedy by Shakespeare. It is said that Queen Elizabeth was so pleased with the Falstaff of Henry IV. that she commanded Shakespeare to show how he conducted himself when in love. For the plot he was probably but little indebted to other writers. *The Two Lovers of Pisa* from Straparola, in Tarleton's *News Out of Purgatory*, and a story from *Il Pecorone* which suggests the hiding of Falstaff in the soiled linen, may possibly have suggested some of the incidents. John Dennis wrote a play, *The Comical Gallant, or the Amours of Sir John Falstaff*, in 1702, in which *The Merry Wives* may be recognized.

Messiah (*me-si'ă*), **The.**—An epic poem in fifteen books, by F. G. Klopstock. The subject is the last days of Jesus, his crucifixion and resurrection.

Middlemarch: *A Study of Provincial Life.*—A novel, by George Eliot, published in 1872, and characterized by *The Quarterly Review* "as the most remarkable work of the ablest of living novelists, and, considered as a study of character, unique." The heroine is Dorothea Brooke, first married to Mr. Casaubon, afterward to Will Ladislaw. Among the other characters are Mr. Lydgate, Rosamond Vincy, Mary Garth, and Mrs. Cadwallader.

Midlothian, or **Mid-Lothian** (*mid-lō'тнi-an*), **The Heart of.**—A tale by Scott, of the Porteous riot, in which the incidents of Effie and Jeanie Deans are of absorbing interest. Effie was seduced by Geordie Robertson (*alias* George Staunton), while in the service of Mrs. Saddletree. She murdered her infant, and was condemned to death; but her half sister Jeanie went to London, pleaded her cause before the queen, and obtained her pardon. Jeanie, on her return to Scotland, married Reuben Butler; and Geordie Robertson (then Sir George Staunton) married Effie. Sir George being shot by a gypsy boy, Effie (*i. e.*, Lady Staunton) retired to a convent on the continent.

Midsummer Night's Dream.—A comedy by Shakespeare. The author says there was a law in Athens that if a daughter refused to marry the husband selected for her by her father, she might be put to death. Ægeus, an Athenian, promised to give his daughter Hermia in marriage to Demetrius; but, as the lady loved Lysander, she refused to marry the man selected by her father, and fled from Athens with her lover. Demetrius went in pursuit of her, followed by Helena, who doted on him. All four came to a forest, and fell asleep. In their dreams a vision of fairies passed before them, and, on awaking, Demetrius resolved to forego Hermia, who disliked him, and to take to wife Helena, who sincerely loved him. When Ægeus was informed thereof, he readily agreed to give his daughter to Lysander, and the force of the law was not called into action (1592).

Mildendo.—*Gulliver's Travels*, Swift. The metropolis of Lilliput, the wall of which was two feet and a half in height, and at least eleven inches thick. The emperor's palace, called Belfaborac, was in the center of the city.

Miles Standish (or, *Courtship of Miles Standish*).—A poem by H. W. Longfellow. From this poem the robust figures of the Puritan captain in his haps and mishaps, and of John Alden and Priscilla, are now part of our national treasures.

Miller, Daisy.—Title and heroine of a story by Henry James. An American girl traveling in Europe, where her innocence, ignorance, and disregard of European customs and standards of propriety put her in compromising situations, and frequently expose her conduct to misconstruction.

Mill on the Floss.—A novel by George Eliot, published in 1860. There is a simplicity about *The Mill on the Floss* which reminds us of the classic tragedy. The vast power of nature over the career and fate of a family is figured forth in the river, beside which the child Maggie played, filling her mother's heart with gloomy and not unveracious presentiments, and down which she passed with Stephen in her hour of temptation, with Tom in her last moments; the whole strength of association and of the ties and instinct of blood breaking in at every critical point in the story, like the voice of a Greek chorus, full of traditionary warning and stern common sense, but speaking in the dialect of English rusticity, and by the mouths of Mr. Tulliver and his wife's relations.

Minna von Barnhelm (*min'ă fon bärn'helm*).—A comedy by Lessing, published in 1767. It is the first German national drama which deals with contemporary events.

Minnehaha (*min-e-hä'hă*).—*Hiawatha*, Henry W. Longfellow. The daughter of the arrow maker of Dacotah, and wife of Hiawatha. She was called Minnehaha from the waterfall of that name.

Minnesingers (*min'e-sing-erz*).—A name given to the German lyric poets of the middle ages, on account of love being the principal theme of their lays, the German word "minne" being used to denote a pure and faithful love.

Miranda.—*The Tempest*, Shakespeare. The daughter of Prospero, the exiled duke of Milan, and niece of Antonio, the usurping duke. She is brought up on a desert island, with Ariel, the fairy spirit, and Caliban, the monster, as her only companions.

Mirlam.—A beautiful and mysterious woman in Hawthorne's romance *The Marble Faun*, for love of whom Donatello commits murder, thus becoming her partner in crime.

Misanthrope, Le (*mi-zăn-trop', lu*).—A comedy by Molière, produced in 1666. This play is an almost inexhaustible source of allusions, quotations, proverbial sayings, etc. Its principal interest lies in the development of various pairs of opposing characters in even their lightest shades. It is the ideal of classic comedy. Alceste, the impatient, but not cynical, hero. Célimène the coquette, Oronte the fop, Éliante the reasonable woman, Arsinœ the mischief maker, are all immortal types.

Misérables, Les [(*mi-zā-rabl', lā*); or, *The Unfortunates.*]—A novel by Victor Hugo, in five parts: *Fantine, Cosette, Marius, L'Idylle Rue Plumet*, and *Jean Valjean*. It was published in 1862.

Morte d'Arthur (*môrt dăr'ther*).—(1) Compilation of Arthurian tales, called on the title page *The History of Prince Arthur*, compiled from the French by Sir Thomas Malory, and printed by William Caxton in 1470. It is divided into three parts. The first part contains the birth of King Arthur, the establishment of the Round Table, the romance of Balin and Balan, and the beautiful allegory of Gareth and Linet. The second part is mainly the romance of Sir Tristram. The third part is the romance of Sir Launcelot, the quest of the holy grail, and the death of Arthur, Guinevere, Tristram, Lamorake, and Launcelot.

(2) An idyll by Tennyson, called *The Passing of Arthur*, in the *Idylls of the King*. The poet supposes Arthur (wounded in the great battle of the west) to be borne off the field by Sir Bedivere. The wounded monarch directed Sir Bedivere to cast Excalibur into the mere. Sir Bedivere then carried the dying king to a barge, in which were three queens, who conveyed him to the island valley of Avilion.

Mualox.—*The Fair God*, Lew Wallace. The old paba or prophet who assured Nenetzin that she was to be the future queen in her father's palace.

Much Ado About Nothing.—A comedy by Shakespeare. It was first printed in 1600. The play was known as *Benedict and Bettris* in 1613, and is probably the same as *Love's Labor's Won*. The story of Hero is taken with some variations from one of Bandello's tales, which probably was borrowed from the story of Geneura and Ariodantes in the *Orlando Furioso* of Ariosto. This part of the play, however, is subordinated by Shakespeare to the loves of Benedict and Beatrice.

Mucklebacket.—*The Antiquary*, Scott. Name of a conspicuous family, consisting of Saunders Mucklebacket, the old fisherman of Musselcrag; Old Elspeth, mother of Saunders; Maggie, wife of Saunders; Steenie, the eldest son, who was drowned; Little Jennie, Saunders' child.

Mumblecrust, Madge.—A character in Edall's *Ralph Roister Doister*, whose name was subsequently employed in Dekker's *Satiro-Mastix*, and the comedy of *Patient Grissel*. Madge is mentioned in the MS. comedy of *Misogonus*.

Münchausen (*münch'hou-zen*), **The Baron.**—A hero of most marvelous adventures, and the fictitious author of a book of travels filled with most extravagant tales. The name is said to refer to Hieronymus Karl Friedrich von Münchausen, a German officer in the Russian army, noted for his marvelous stories.

Mutual Friend, Our.—A novel by Charles Dickens. The "mutual friend" is Mr. Boffin, the golden dustman, who was the mutual friend of John Harmon and of Bella Wilfer. The tale is this: John Harmon was supposed to have been murdered by Julius Handford; but it was Ratford, who was murdered by Rogue Riderhood, and the mistake arose from a resemblance between the two persons. By his father's will, John Harmon was to marry Bella Wilfer; but John Harmon knew not the person destined by his father for his wife, and made up his mind to dislike her. After his supposed murder, he assumed the name of John Rokesmith, and became the secretary of Mr. Boffin, "the golden dustman," residuary legatee of old John Harmon, by which he became possessor of one hundred thousand dollars. Boffin knew Rokesmith, but concealed his knowledge for a time. At Boffin's house John Harmon (as Rokesmith) met Bella Wilfer, and fell in love with her. Mr. Boffin, in order to test Bella's love, pretended to be angry with Rokesmith for presuming to love Bella; and, as Bella married him, he cast them both off "for a time," to live on John's earnings. A babe was born, and then the husband took the young mother to a beautiful house, and told her he was John Harmon, that the house was their house, that he was the possessor of five hundred thousand dollars through the disinterested conduct of their "mutual friend," Mr. Boffin, and the young couple live happily with Mr. and Mrs. Boffin, in wealth and luxury.

My Novel.—A work of fiction by Edward, Lord Lytton, published in 1853. It is described as the "great work which marks the culminating point in Lord Lytton's genius, the work to which, with a rare estimate of his own powers, he has given the singularly appropriate title of *My Novel*. . . . If we except one or two melodramatic scenes, it is throughout an admirable work. . . . The plot is complex, but it is unfolded with marvelous directness and ingenuity, and, notwithstanding the digressions, the interest never for a moment flags." Among the characters are Squire Hazeldean, Mr. Dale, Dick Avenel, Leonard Fairfield, and Harley L'Estrange.

N

Nathan the Wise [*Nathan der Wise* (*nä'tän der vī'ze*).]—A drama by G. E. Lessing, so called from the name of its principal character. Its tendency is toward religious tolerance, especially in the episode of the three rings, which was taken from Boccaccio. Nathan is a persecuted but noble Jew, an ideal character resembling Moses Mendelssohn.

Natty Bumppo.—Called "Leather-Stocking." He appears in five of Cooper's novels: (1) *The Deerslayer;* (2) *The Pathfinder;* (3) As "Hawk-eye" in *The Last of the Mohicans;* (4) "Natty Bumppo" in *The Pioneers;* and (5) as the "Trapper" in *The Prairie*, in which he dies.

Neæra (*nē-ē'rä*).—The name of a girl mentioned by the Latin poets Horace, Vergil, and Tibullus; sometimes also introduced into modern pastoral poetry as the name of a mistress or sweetheart.

Nepenthe.—A care-dispelling drug, which Polydamna, wife of Thonis, king of Egypt, gave to Helen. A drink containing this drug "changed grief to mirth, melancholy to joyfulness, and hatred to love." The water of Ardenne had the opposite effects. Homer mentions this drug nepenthe in his *Odyssey*. It is also mentioned in Poe's *Raven*.

New Atlantis, The.—An imaginary island in the middle of the Atlantic. Bacon, in his allegorical fiction, so called, supposes himself wrecked on this island,

where he finds an association for the cultivation of natural science and the promotion of arts. Called the "New" Atlantis to distinguish it from Plato's Atlantis, an imaginary island of fabulous charms.

Newcomes, The.—*Memoirs of a Most Respectable Family*, by William Makepeace Thackeray. The hero is Clive Newcome, a young artist, son of Colonel Newcome, and cousin of Ethel Newcome, whom he marries after the death of his first wife, Rosa Mackenzie. Among the other characters are Comte de Florac, Charles Honeyman, "J. J.," Fred Bayham, Lady Kew, Jack Belsize, Dr. Goodenough, and others.

Colonel Newcome, is "the finest portrait," says Hannay, "that has been added to the gallery of English fiction since Sir Walter's time. The pathos, at once manly and delicate, with which his ruin and death are treated, places Thackeray in a high rank in poetic sentiment."

Nibelungenlied (*nē'be-loong-en-lēd*).—An historic poem, generally called the German *Iliad*. It is the only great national epic that European writers have produced since antiquity, and belongs to every country that has been peopled by Germanic tribes, as it includes the hero traditions of the Franks, the Burgundians and the Goths, with memorials of the ancient myths carried with them from Asia. The poem is divided into two parts, and thirty-two lieds, or cantos. The first part ends with the death of Siegfried, and the second part with the death of Kriemhild. The death of Siegfried and the revenge of Kriemhild have been celebrated in popular songs dating back to the lyric chants now a thousand years old. These are the foundation of the great poem.

Nicholas Nickleby.—A novel by Dickens. The mother of the hero, Nicholas, is a widow fond of talking and of telling long stories with no connection. She imagined her neighbor, a mildly insane man, was in love with her because he tossed cabbages and other articles over the garden wall. She had a habit of introducing in conversation topics wholly irrelevant to the subject under consideration, and of always declaring, when anything unanticipated occurred, that she had expected it all along, and had prophesied to that precise effect on divers (unknown) occasions. Nicholas Nickleby has to make his own way in the world. He first goes as usher to Mr. Squeers, schoolmaster at Dotheboys Hall; but leaves in disgust with the tyranny of Squeers and his wife, especially to a poor boy named Smike. Smike runs away from the school to follow Nicholas, and remains his humble follower till death. At Portsmouth, Nicholas joins the theatrical company of Mr. Crummles, but leaves the profession for other adventures. He falls in with the Brothers Cheeryble, who make him their clerk; and in this post he rises to become a merchant, and finally marries Madeline Bray.

Nightingale, Ode to a.—Poem by John Keats, which "was written," says Leigh Hunt, "in a house at the foot of Highgate Hill, on the border of the fields looking toward Hampstead. The poet had then his mortal illness upon him, and knew it; never was the voice of death sweeter."

Thou wast not born for death, immortal Bird!
No hungry generations tread thee down;
The voice I hear this passing night was heard
In ancient days by emperor and clown;
Perhaps the selfsame song that found a path
Through the sad heart of Ruth, when, sick for home,
She stood in tears amid the alien corn;
The same that ofttimes hath
Charm'd magic casements, opening on the foam
Of perilous seas, in faëry lands forlorn.

Notre Dame de Paris.—A prose romance by Victor Hugo, published in 1831. The scene is laid in Paris at the end of the reign of Louis XI. It is a vigorous but somber picture of mediæval manners.

Nourmahal (*nör-ma-häl'*).—*Lalla Rookh*, Moore. "Light of the Harem." She was for a season estranged from the sultan, till he gave a grand banquet, at which she appeared in disguise as a lute-player and singer. The sultan was so enchanted with her performance that he exclaimed, "If Nourmahal had so played and sung, I could forgive her all;" whereupon the sultana threw off her mask.

Nucta.—*Paradise and the Peri*, Moore. The name given to the miraculous drop which falls from heaven, in Egypt, on St. John's day, and is supposed to stop the plague.

Nun of Nidaros.—*Tales of a Wayside Inn*, Longfellow. The abbess of the Drontheim convent, who heard the voice of St. John while she was kneeling at her midnight devotions.

Nut-Brown Maid.—*Reliques*, Percy. The maid who was wooed by the "banished man." The "banished man" described to her the hardships she would have to undergo if she married him; but finding that she accounted these hardships as nothing compared with his love, he revealed himself to be an earl's son, with large hereditary estates in Westmoreland, and married her.

O

Obermann (*ō-ber-män'*).—The impersonation of high moral worth without talent, and the tortures endured by the consciousness of this defect. This name was given to the hero and imaginary author of a work of the same name by Etienne Pivert de Senancourt, a French writer.

Oberon (*ō'be-ron*).—King of the fairies, whose wife was Titania. Shakespeare introduces both Oberon and Titania in his *Midsummer Night's Dream*. He and Titania, his queen, are fabled to have lived in India, and to have crossed the seas to northern Europe to dance by the light of the moon.

Oberon the Fay.—A humpty dwarf only three feet high, but of angelic face, lord and king of Mommur.

Odyssey (*od'i-si*).—Homer's epic poem recording the adventures of Odysseus (Ulysses) in his voyage home from Troy. The poem opens in the island of Calypso, with a complaint against Neptune and Calypso for preventing the return of Odysseus to Ithaca. Telemachos, the son of Odysseus, starts in search of his father, accompanied by Pallas in the guise of Mentor. He goes to Pylos to consult old Nestor, and is sent by him to Sparta, where he is told by Menelaus that Odysseus is detained in the island of Calypso. In the meantime, Odysseus leaves the island, and, being shipwrecked, is cast on the shore of Phæacia. After twenty years' absence Odysseus returns to his home. Penelope is tormented by suitors. To excuse herself, Penelope tells her suitors he only shall be her husband who can bend Odysseus' bow. None can do so but the stranger, who bends it with ease. Odysseus is recognized by his wife, and the false suitors are all slain, and peace is restored to Ithaca.

Œdipus (*ed'i-pus*) **Coloneus** [(*kō-lō-nē'us*); or, *Œdipus at Colonus* (*kō-lō'nus*)].—A tragedy of Sophocles, which was not exhibited till four years after his death, and was said to be the last he wrote. In it Œdipus, driven from Thebes by Creon, with his daughters, Antigone and Ismene, seeks asylum with Theseus at Athens, and there obtains pardon from the gods, and peace.

Œdipus Tyrannus (*ti-ran'us*).—A tragedy by Sophocles, of uncertain date, "placed by the scholiasts, and by most modern critics, at the very summit of Greek tragic art."

Ogier (*ō-zhyā'*) **the Dane.**—One of the paladins of the Charlemagne epoch. Also made the hero of an ancient French romance, and the subject of a ballad whose story is probably a contribution from the stores of Norman tradition, Holger, or Olger, Danske, being the national hero of Denmark. He figures in Ariosto's *Orlando Furioso*.

O'Groat.—A name often alluded to in early English parables or sayings coming from the legend of *John O'Groat's House*. This ancient building was supposed to stand on the most northerly point in Great Britain. John of Groat and his brothers were originally from Holland. According to tradition, the house was of an octagonal shape, being one room with eight windows and eight doors, to admit eight members of the family, the heads of eight different branches of it, to prevent their quarrels for precedence at table, which, on a previous occasion, had well-nigh proved fatal.

Oldbuck, Jonathan.—*Antiquary*, Scott. The character whose whimsies gave name to the novel. He is represented as devoted to the study and accumulation of old coins, medals, and relics. He is irritable, sarcastic, and cynical from an early disappointment in love, but full of humor and a faithful friend.

Old Curiosity Shop, The.—A tale by Charles Dickens. An old man, having run through his fortune, opened a curiosity shop in order to earn a living and brought up a granddaughter, named Nell [Trent], fourteen years of age. The child was the darling of the old man, but, deluding himself with the hope of making a fortune by gaming, he lost everything, and went forth, with the child, a beggar. Their wanderings and adventures are recounted till they reach a quiet country village, where the old clergyman gives them a cottage to live in. Here Nell soon dies, and the grandfather is found dead upon her grave. The main character, next to Nell, is that of a lad named Kit [Nubbles], employed in the curiosity shop, who adored Nell as "an angel." This boy gets in the service of Mr. Garland, a genial, benevolent, well-to-do man, in the suburbs of London; but Quilp hates the lad, and induces Brass, a solicitor of Bevis Marks, to put a five pound banknote in the boy's

hat, and then accuse him of theft. Kit is tried, and condemned to transportation; but, the villainy being exposed by a girl-of-all-work nicknamed "The Marchioness," Kit is liberated and restored to his place, and Quilp drowns himself.

Old Man of the Sea.—In the *Arabian Nights*, a monster encountered by Sindbad the sailor in his fifth voyage. After carrying him upon his shoulders a long time, Sindbad at last succeeds in intoxicating him, and effects his escape. The *Old Man of the Sea* was also made the title of a humorous and well-known poem by O. W. Holmes.

Old Mortality, the best of Scott's historical novels. Morton is the best of his young heroes, and serves as an excellent foil to the fanatical and gloomy Burley. The two classes of actors, *viz.*, the brave and dissolute cavaliers, and the resolute oppressed covenanters, are drawn in bold relief. The most striking incidents are the terrible encounter with Burley in his rocky fastness; the dejection and anxiety of Morton on his return from Holland; and the rural comfort of Cuddie Headrigg's cottage on the banks of the Clyde, with its thin blue smoke among the trees, "showing that the evening meal was being made ready." Old Mortality is an itinerant antiquary, whose craze is to clean the moss from gravestones, and keep their letters and effigies in good condition.

Old Red Sandstone.—One of the most noted of Hugh Miller's famous writings on geological subjects. It revealed his discovery of fossils in a formation which, up to that time, had been deemed almost destitute of them.

Oliver.—*As You Like It*, Shakespeare. Son and heir of Sir Rowland de Bois, who hated his youngest brother, Orlando, and whom he planned to murder by indirect methods. Orlando, finding it impossible to live in his brother's house, fled to the forest of Arden, where he joined the society of the banished duke. Oliver pursued him, and as he slept in the forest a snake and a lioness lurked near to make him their prey. Orlando chanced to be passing, slew the two monsters, and then found that the sleeper was his brother Oliver. Oliver's feelings underwent a change, and he loved his brother as much as he had before hated him. In the forest the two brothers met Rosalind and Celia. The former, who was the daughter of the banished duke, married Orlando; and the latter, who was the daughter of Frederick, the usurping duke, married Oliver.

Oliver Twist.—A novel by Charles Dickens. Thackeray, writing of this novel, in the character of "Ikey Solomons," says: "The power of the writer is so amazing that the reader at once becomes his captive, and must follow him whithersoever he leads: and to what are we led? Breathless to watch all the crimes of Fagin, tenderly to deplore the errors of Nancy, to have for Bill Sikes a kind of pity and admiration, and an absolute love for the society of the Dodger. All these heroes stepped from the novel on to the stage; and the whole London public, from peers to chimney sweeps, were interested about a set of ruffians whose occupations are thievery, murder, and prostitution." A remarkable feature of the work, and one which, on its publication, brought considerable odium on the writer, was its unsparing exposure of the poor-law and the workhouse system, which led to its representation on the stage being forbidden for a time.

Olivia.—*Twelfth Night*, Shakespeare. A rich countess, whose love was sought by Orsino, duke of Illyria; but, having lost her brother, Olivia lived for a time in entire seclusion, and in no wise reciprocated the duke's love. Olivia fell in love with Viola, who was dressed as the duke's page, and sent her a ring. Mistaking Sebastian (Viola's brother) for Viola, she married him out of hand.

Ophelia (*ō-fē'liȧ*).—*Hamlet*, Shakespeare. Daughter of Polonius, the chamberlain. Hamlet fell in love with her, but, after his interview with the Ghost, finds that his plans must lead away from her. During his real or assumed madness, he treats her with undeserved and angry rudeness, and afterward, in a fit of inconsiderate rashness, kills her father, the old Polonius. The terrible shock given to her mind by these events completely shatters her intellect, and leads to her accidental death by drowning.

Organon (*ôr'ga-non*).—The name given to the first work on logic by Aristotle. He is said to have created the science of logic. The *Organon* has been enlarged and recast by some modern authors, especially by Mr. John Stuart Mill in his *System of Logic*, into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day.

Origin of Species, The.—A work by Charles Robert Darwin, in which he put forward his theory of "natural selection." It was published in 1859, and by many is regarded as the most important scientific work of the nineteenth century.

Orlando Furioso (*or-län'dō fō-rē-ō'sō*).—An epic poem in forty-six cantos, by Ariosto, which occupied his leisure for eleven years, and was published in 1516. This poem, which celebrates the semi-mythical achievements of the paladins of Charlemagne in the wars between the Christians and the Moors, became immediately popular, and has since been translated into all European languages, and passed through innumerable editions.

Ormulum (*ôr'mū-lum*).—The *Ormulum* is a collection of metrical homilies, one for each day of the year; but the single existing copy gives the homilies for thirty-two days only. There are very few French words in the poem, but Scandinavian words and constructions abound. The writer, Orm, or Ormin, belonged to the east of England, and he and his brother Walter were Augustinian monks. He makes no use of rhyme, but his verses are smooth and regular.

Osbaldistone (*os-bâl'dis-ton*).—*Rob Roy*, Scott. A family name in the story which tells of nine of the members: (1) the London merchant and Sir Hildebrand, the heads of two families; (2) the son of the merchant is Francis; (3) the offspring of the brother are Percival, the sot; Thorncliffe, the bully; John, the gamekeeper: Richard, the horse-jockey; Wilfred, the fool; and Rashleigh, the scholar, by far the worst of all. This last worthy is slain by Rob Roy, and dies cursing his cousin Frank, whom he had injured.

O'Shanter.—See *Tam O'Shanter*.

Osman (*os-män'*).—Sultan of the East, conqueror of the Christians, a magnanimous man. He loved Yara, a young Christian captive. This forms the subject of a once famous ballad.

Osrick (*oz'rik*).—A court fop in Shakespeare's *Hamlet*. He is made umpire by Claudius in the combat between Hamlet and Laertes.

Osseo.—*Hiawatha*, Longfellow. Son of the Evening Star. When broken with age, he married Oweenee, one of ten daughters of a northland hunter. She loved him in spite of his ugliness and decrepitude, because "all was beautiful within him." As he was walking with his nine sisters-in-law and their husbands, he leaped into the hollow of an oak tree and came out strong and handsome; but Oweenee at the same moment was changed into a weak old woman. But the love of Osseo was not weakened. The nine brothers and sisters-in-law were transformed into birds. Oweenee, recovering her beauty, had a son, whose delight was to shoot the birds that mocked his father and mother. An Algonquin legend gave the foundation of the story.

Othello (*ō-thel'ō*).—A tragedy by Shakespeare. The chief character is a Moor of Venice, who marries Desdemona, the daughter of a Venetian senator, and is led by his ensign, Iago, a consummate villain, to distrust her fidelity and virtue. Iago hated the Moor both because Cassio, a Florentine, was preferred to the lieutenancy instead of himself, and also from a suspicion that the Moor had tampered with his wife; but he concealed his hatred so well that Othello wholly trusted him. Iago persuaded Othello that Desdemona intrigued with Cassio, and urged him on till he murdered his bride.

Outre-Mer (*ōōtr-mèr*).—*A Pilgrimage Beyond the Sea.*—A series of prose tales and sketches by Henry Wadsworth Longfellow, published in 1835. "The Pays d'Outre-Mer," says the writer, "is a name by which the pilgrims and crusaders of old designated the Holy Land. I, too, in a certain sense, have been a pilgrim of Outre-Mer; for to my youthful imagination the Old World was a kind of Holy Land, lying afar off beyond the blue horizon of the ocean. In this, my pilgrimage, I have traversed France from Normandy to Navarre; smoked my pipe in a Flemish inn; floated through Holland in a Trekschuit; trimmed my midnight lamp in a German university; wandered and mused amid the classic scenes of Italy; and listened to the gay guitar and merry castanet on the borders of the blue Guadalquivir."

P

Pacolet (*pak'ō-let*).—In *Valentine and Orson*, an old romance, a character who owned an enchanted steed, often alluded to by early writers. The name of Pacolet was borrowed by Steele for his familiar spirit in the *Tatler*. The French have a proverb, "It is the horse of Pacolet;" that is, it is one that goes very fast.

Page.—*Merry Wives of Windsor*, Shakespeare. Name of a family of Windsor, conspicuous in the play. When Sir John Falstaff made love to Mrs. Page, Page himself assumed the name of Brook. Sir John told the supposed Brook his whole "course of wooing."

Page, Anne.—Daughter of the above, in love with Fenton. Slender calls her "the sweet Anne Page."

Page, Mrs.—Wife of Mr. Page, of Windsor. When Sir John Falstaff made love to her, she joined with Mrs. Ford to dupe him and punish him.

Palamon.—(1) A character in *The Knight's Tale* in Chaucer's *Canterbury Tales*, in love with Emilia, who is also beloved by Palamon's friend, Arcite. (2) In Falconer's poem of *The Shipwreck*, is in love with the daughter of Albert, the commander of the vessel in which he sails. (3) In Thomson's poem of *Autumn* in *The Seasons*, is a young man, "the pride of swains," in love with Lavinia. He is a poetical representation of Boaz, while Lavinia is intended for Ruth.

Pangloss (*pan'glos*), **Doctor.**—(1) A poor pedant, in Colman the Younger's comedy of the *Heir at Law*, who has been created an *Artium Societatis Socius* (*A. S. S.*). He is remarkable for the aptness, if triteness, of his quotations. (2) An optimist philosopher in Voltaire's *Candide*.

Pantagruelian (*pan-tag'rō-el-an*) **Law Case.**—*Pantagruel*, Rabelais. This case, having nonplused all the judges in Paris, was referred to Lord Pantagruel for decision. After much "statement" the bench declared, "We have not understood one single circumstances of the defense." Then Pantagruel gave sentence, but his judgment was as unintelligible as the case itself. So, as no one understood a single sentence of the whole affair, all were perfectly satisfied.

Paracelsus (*par-a-sel'sus*).—A dramatic poem by Robert Browning, published in 1835. It is a work of singular beauty, and is replete with lofty and solemn thoughts on the fate of genius and the chance and change of life. The Paracelsus of the poem is a very different person from the Paracelsus of history—the brilliant and daring quack who professed to have discovered the philosopher's stone, but who, by the introduction of opium among the remedies of the *Pharmacopœia*, in some wise made amends for his absurd extravagance.

Paradise and the Peri.—The second tale in Moore's poetical romance of *Lalla Rookh*. The Peri laments her expulsion from heaven, and is told that she will be readmitted if she will bring to the gate of heaven the "gift most dear to the Almighty." After several failures the Peri offered the "Repentant Tear," and the gates flew open to receive the gift.

Paradise Lost.—An epic poem by Milton. The poem opens with the awaking of the rebel angels in hell after their fall from heaven, the consultation of their chiefs how best to carry on the war with God, and the resolve of Satan to go forth and tempt newly created man to fall. Satan reaches Eden, and finds Adam and Eve in their innocence. This is told in the first four books. The next four books contain the Archangel Raphael's story of the war in heaven, the fall of Satan, and the creation of the world. The last four books describe the temptation and the fall of man, and tell of the redemption of man by Christ, and the expulsion from Paradise.

Paradise Regained.—An epic by Milton on the redemption of man. In this poem the author tells of the journey of Christ into the wilderness after his baptism, and its four books describe the temptation of Christ by Satan.

Parallel Lives of Greeks and Romans.—A celebrated biographical work by Plutarch, consisting of forty-six comparisons. In spite of all exceptions on the score of inaccuracy, want of information, or prejudice, *Plutarch's Lives* must remain one of the most valuable relics of Greek literature, not only because they stand in the place of many volumes of lost history, but also because they are written with a graphic and dramatic vivacity such as we find in few biographies, ancient or modern; because they are replete with reflections which, if not profound, are always moderate and sensible; and because the author's aim throughout is to enforce the highest standard of morality of which a heathen was capable. As one of his most enthusiastic admirers has said, "He stands before us as the legate, the ambassador, and the orator on behalf of those institutions whereby the old-time men were rendered wise and virtuous."

Partington (*pär'ting-ton*), **Mrs.**—An imaginary old lady whose laughable sayings have been recorded by an American humorist, B. P. Shillaber.

Paul and Virginia.—A popular romance by Bernardin de St. Pierre. According to a tradition, or version, Paul and Virginia are brought up in the belief that they are brother and sister. Don Antonio is sent to bring her to Spain, and make her his bride. She is taken by force on board ship, but scarcely has the ship started, when a hurricane dashes it on the rocks and it is wrecked. Alhambra, a runaway slave, whom Paul and Virginia had befriended, rescues Virginia, who is brought to shore and married to Paul. Antonio is drowned.

Pauline.—The Lady of Lyons in Bulwer-Lytton play's of this name. She was married to Claude Melnotte, a gardener's son, who pretended to be a count.

Paul Pry.—*Paul Pry*, John Poole. An idle, inquisitive, meddlesome fellow, who has no occupation of his own, and is forever poking his nose into other people's affairs. He always comes in with the apology "I hope I don't intrude."

Peau de Chagrin (*pō du shā-grin*), "*The Ass' Skin.*"—A story by Balzac. The hero becomes possessed of a magical wild ass' skin, which yields him the means of gratifying every wish; but for every wish thus gratified the skin shrank somewhat, and at last vanished, having been wished entirely away. Life is a *peau d'âne*, for every vital act diminishes its force, and when all its force is gone, life is spent.

Peeping Tom of Coventry.—A tailor of Coventry, the only soul in the town mean enough to peep at the Lady Godiva as she rode naked through the streets to relieve the people from oppression.

Peggotty (*peg'o-ti*), **Clara.**—The nurse of David Copperfield in Dickens' novel of this name. Being very plump, whenever she makes any exertion some of the buttons on the back of her dress fly off.

Peggotty, Dan'l.—Brother of David Copperfield's nurse. Dan'l was a Yarmouth fisherman. His nephew, Ham Peggotty, and his brother-in-law's child, "little Em'ly," lived with him.

Peggotty, Em'ly.—She was engaged to Ham Peggotty; but being fascinated with Steerforth she eloped. She was afterward reclaimed, and emigrated to Australia.

Peggotty, Ham.—Represented as the very beau ideal of an uneducated, simple-minded, honest, and warm-hearted fisherman. He was drowned in his attempt to rescue Steerforth from the sea.

Pendennis (*pen-den'is*), **The History of.**—By William Makepeace Thackeray. The hero, Arthur Pendennis, reappears in the author's *Adventures of Philip*, and is represented as telling the story of *The Newcomes*.

Pendennis.—Name of the hero of a novel by Thackeray, published in 1849 and 1850, the immediate successor of *Vanity Fair*. Literary life is described in the history of Pen, a hero of no very great worth.

Pendennis, Laura.—Sister of Arthur, considered one of the best of Thackeray's characters.

Pendennis, Major.—A tuft-hunter, who fawns on his patrons for the sake of wedging himself into their society.

Penseroso (*pen-se-rō'sō*), **Il.**—A poem by John Milton, written as a companion to *L'Allegro*. The latter is composed in the character of a cheerful, the former in that of a melancholy, man, and the whole tone of each poem is regulated accordingly. The one begins with the dawn, the other with evening. The one opens with the lark, the other with the nightingale, and so on.

Pepys, (*pēps*, or *pips*, or *pep'is*) **Diary.**—A book by Samuel Pepys, written in shorthand, and deciphered and published in 1825. It extends over the nine years from 1660 to 1669, and is the gossipy chronicle of that gay and profligate time. We have no other book which gives so lifelike a picture of that extraordinary state of society.

Peregrine Pickle (*per'e-grin pik'l*).—The title of a novel by Smollett. Peregrine Pickle is a savage, ungrateful spendthrift, fond of practical jokes, and suffering with evil temper the misfortunes brought on himself by his own willfulness.

Peter Bell.—A tale in verse, by Wordsworth. A wandering tinker, subject of Wordsworth's poem, whose hard heart was touched by the fidelity of an ass to its dead master. Shelley wrote a burlesque of this poem, entitled *Peter Bell the Third*, intended to ridicule the ludicrous puerility of language and sentiment which Wordsworth often affected. This burlesque was given the name of the *Third* because it followed a parody already published as *Peter the Second*.

Petruchio (*pe-trō'chō*, or *ki-ō*).—A gentleman of Verona in Shakespeare's *Taming of the Shrew*. A very honest' fellow, who hardly speaks a word of truth, and succeeds in all his tricks. He acts his assumed character to the life, with untired animal spirits, and without a particle of ill-humor.

Phædo (*fē'dō*), or **Phædon** (*fē'don*).—An ancient and well known work by Plato, in which the doctrine of the immortality of the soul is most fully set forth. It is in the form of a dialogue, which combines, with the abstract philosophical discussion, a graphic narrative of the last hours of Socrates, which, for pathos and dignity, is unsurpassed.

Phèdre (*fā'dr*).—A tragedy by Racine, produced January 1, 1677. It was founded on the story of Phædra, daughter of Minos, king of Crete, and wife of Theseus.

She conceived a criminal love for Hippolytus, her stepson, and, being repulsed by him, accused him to her husband of attempting to dishonor her. Hippolytus was put to death, and Phædra, wrung with remorse, strangled herself. *Phédre* was the great part of Mdlle. Rachel; she first appeared in this character in 1838. It is unquestionably the most remarkable of Racine's regular tragedies. By it the style must stand or fall, and a reader need hardly go farther to appreciate it. For excellence of construction, artful beauty of verse, skillful use of the limited means of appeal at the command of the dramatist, no play can surpass *Phèdre*.

Philip.—*The Madness of Philip*, Josephine Daskam. A representation of the unregenerate child—"the child of strong native impulses who has not yet yielded to the shaping force of education; the child, therefore, of originality, of vivacity, of humor, and of fascinating power of invention in the field of mischief.

Philippics (*fi-lip'iks*), **The.**—A group of nine orations of Demosthenes, directed against Philip of Macedon. The real adversary in all these famous speeches is not so much the king of Macedon as the sloth and supineness of the Athenians, and the influence of the peace party, whether honest or bribed by Philip. They are the first Philippic, urging the sending of a military force to Thrace, delivered 351 B. C.; three orations in behalf of the city of Olynthus (destroyed by Philip), delivered in 349-348; the oration *On the Peace*, 346; the second Philippic, 344; the oration *On the Embassy*, 344; the speech *On the Chersonese*, 341; and the third Philippic, 341.

The name is also given to a series of fourteen orations of Cicero against Mark Antony, delivered 44-43 B. C.

Philtra.—*Faërie Queene*, Spenser. A lady of large fortune, betrothed to Bracidas; but, seeing the fortune of Amidas daily increasing, and that of Bracidas getting smaller, she attached herself to the more prosperous younger brother.

Phineas (*fin'e-as*).—*Uncle Tom's Cabin*, Mrs. Stowe. The quaker, an "underground railroad" man who helped the slave family of George and Eliza to reach Canada, after Eliza had crossed the river on cakes of floating ice.

Phyllis (*fil'is*).—In Vergil's *Eclogues*, the name of a rustic maiden. This name, also written Phillis, has been in common use as meaning any unsophisticated country girl.

Pickwick (*pik'wik*), **Mr. Samuel.**—The hero of the *Pickwick Papers*, by Charles Dickens. He is a simple-minded, benevolent old gentleman, who wears spectacles and short black gaiters. He founds a club, and travels with its members over England, each member being under his guardianship. They meet many laughable adventures.

Pied Piper of Hameln (*hä'meln*).—Old German legend. Robert Browning, in his poem entitled *The Pied Piper*, has given a metrical version. The legend recounts how a certain musician came into the town of Hameln, in the country of Brunswick, and offered, for a sum of money, to rid the town of the rats by which it was infested. Having executed his task, and the promised reward having been withheld, he in revenge blew again his pipe, and by its tones drew the children of the town to a cavern in the side of a hill, which, upon their entrance, closed and shut them in forever.

Piers Plowman (*pērs plou'man*).—A satirical poem of the fourteenth century. The hero falls asleep, like John Bunyan, on the Malvern hills, and has different visions, which he describes, and in which he exposes the corruptions of society, the dissoluteness of the clergy, and the allurements to sin. The author is supposed to be Robert or William Langland. No other writings so faithfully reflect the popular feeling during the great social and religious movements of that century as the bitterly satirical poem, *The Vision of Piers Plowman*. In its allegory, the discontent of the commons with the course of affairs in church and state found a voice.

Pietro.—*The Ring and the Book*, Browning. The professed father of Pompilia, criminally assumed as his child to prevent certain property from passing to an heir not his own.

Pilgrim's Progress.—A celebrated allegory by Bunyan. It recounts the adventures of the hero, Christian, from his conversion to his death. He wanders from the way to Doubting Castle, and is held there by Giant Despair. His sins are a pack; his Bible is a chart, his minister Evangelist, his conversion a flight from the City of Destruction, his struggle with besetting sins a fight with Apollyon, his death a toilsome passage over a deep stream which flows between him and heaven.

Pilot, The.—Title of a sea-story by Cooper, which was called the "first sea-novel of the English language." It was published in the year 1823, and soon translated into Italian, German, and French. It is founded on the adventures of John Paul Jones.

Pinch, Tom.—A character in Dickens' *Martin Chuzzlewit*, distinguished by his guilelessness, his oddity, and his exhaustless goodness of heart.

Pippa (*pēp'pä*) **Passes.**—A drama, Italian in scene and character, by Robert Browning. "It is," says Stedman "a cluster of four scenes, with prologue, epilogue, and interludes, half prose, half poetry, varying with the refinement of the dialogue. Pippa is a delicately pure, good, blithesome peasant maid. It is New Year's Day at Ardo. She springs from bed at sunrise, resolved to enjoy to the full her sole holiday. Others may be happy throughout the year; haughty Ottima and Sebald, the lovers on the hill; Jules and Phene, the artist and his bride; Luigi and his mother; Monsignor, the bishop; but Pippa has only this one day to enjoy. Now, it so happens that she passes, this day, each of the groups or persons we have named, at an important crisis in their lives, and they hear her various carols as she trills them forth in the innocent gladness of her heart. *Pippa Passes* is a work of pure art, and has a wealth of original fancy and romance, apart from its wisdom." It appeared in 1842.

Pistol (*pis'tol*).—A follower of Falstaff, in Shakespeare's comedy of *The Merry Wives of Windsor*, and in the second part of *King Henry IV*. "A roguing beggar, a chantler, an upright man that liveth by cozenage."

Pocket.—*Great Expectations*, Dickens. Name of a family prominent in the story.

Pocket.—A real scholar, educated at Harrow, and an honor-man at Cambridge, but, having married young, he had to take up the calling of "grinder" and literary fag for a living. Pip was placed in his care.

Pocket, Herbert.—Son of Mr. Matthew Pocket, wonderfully hopeful, but had not the stuff to push his way into wealth.

Pocket, Mrs.—Daughter of a city knight, brought up to be an ornamental nonentity, helpless, shiftless, and useless. She was the mother of eight children, whom she allowed to "tumble up" as best they could, under the charge of her maid, Flopson.

Pocket, Sarah.—Sister of Matthew Pocket, a little, dry, old woman, with a small face that might have been made of walnut-shell, and a large mouth.

Poor Richard's Almanac.—An almanac published by Benjamin Franklin, 1732-1757, noted for its maxims. He made it the medium for teaching thrift, temperance, order, cleanliness, chastity, forgiveness, and so on. The maxims or precepts of these almanacs generally end with the words, "as poor Richard says."

Portia (*pôr'shiä*).—In *The Merchant of Venice*, a rich heiress, whose hand and fortune hang upon the right choosing between a gold, a silver, and a leaden casket. She is in love with Bassanio, who, luckily, chooses well. She appears at the trial of Antonio as a "young doctor of Rome," named Balthazar.

Poyser (*poi'zer*), **Mrs.**—A character in *Adam Bede*. Some of her wonderfully shrewd and humorous observations have passed into the language. Here are some specimens: "It seems as if them as aren't wanted here are th' only folks as aren't wanted in the other world." "I'm not denyin' the women are foolish; God Almighty made 'em to match the men." "It's hard to tell which is Old Harry when everybody's got boots on." "There's many a good bit o' work done with a sad heart." "It's poor work allays settin' the dead above the livin'. It 'ud be better if folks 'ud make much on us beforehand, istid o' beginning when we're gone." "Some folks' tongues are like the clocks as run on strikin' not to tell you the time of day, but because there's summat wrong in their own inside."

Précieuses Ridicules (*prā-syuz' ri-di-kul'*), **Les.**—A comedy by Molière, in ridicule of the *Préceuses*, as they were styled, forming the coterie of the Hotel de Rambouillet in the seventeenth century. The *soirées* held in this hotel were a great improvement on the licentious assemblies of the period; but many imitators made the thing ridiculous, because they lacked the same presiding talent and good taste.

The two girls of Molière's comedy are Madelon and Cathos, the daughter and niece of Gargibus, a bourgeois. They change their names to Polixène and Aminte, which they think more genteel, and look on the affectations of two flunkies as far more *distingués* than the simple, gentlemanly manners of their masters. However, they are cured of their folly, and no harm comes of it.

Prelude (*prē'lūd*, or *prel'ūd*), **The,** or *The Growth of a Poet's Mind.*—An autobiographical poem, in blank verse, by William Wordsworth. It was intended as an introduction to "a philosophical poem, containing views of Man, Nature, and Society; and to be entitled

The Recluse, as having for its principal subject the sensations and opinions of a poet living in retirement." This poem was to have consisted of three parts, of which the second only, *The Excursion*, was completed and published. *The Prelude* consists of fourteen books: Book one, *Childhood and Schooltime;* book two, *Schooltime*, continued; book three, *Residence at Cambridge;* book four, *Summer Vacation;* book five, *Books;* book six, *Cambridge and the Alps;* book seven, *Residence in London;* book eight, *Retrospect—Love of Nature Leading to Love of Man;* book nine, *Residence in France;* book ten, *Residence in France*, continued; book eleven, *France*, concluded; book twelve, *Imagination and Taste, How Impaired and Restored;* book thirteen, the same subject continued and concluded; and book fourteen, *Conclusion*.

Primrose (*prim'rōz*), **Rev. Charles.**—*Vicar of Wakefield*, Goldsmith. A clergyman, rich in heavenly wisdom, but poor indeed in all worldly knowledge.

Primrose, Moses.—Brother of the above, noted for giving in barter a good horse for a gross of worthless green spectacles with copper rims.

Primrose, Olivia.—The eldest daughter of the doctor. Pretty, enthusiastic, a sort of Hebê in beauty. "She wished for many lovers," and eloped with Squire Thorndill.

Primrose, Sophia.—The second daughter of Dr. Primrose. She was "soft, modest, and alluring."

Princess: *a Medley.*—A poem by Alfred Tennyson. "It is," says Stedman, "as he entitles it, a medley, constructed of ancient and modern materials—a show of mediæval pomp and movement, observed through an atmosphere of latterday thought and emotion. The poet, in his prelude, anticipates every stricture, and to me the anachronisms and impossibilities of the story seem not only lawful, but attractive. Tennyson's special gift of reducing incongruous details to a common structure and tone is fully illustrated in a poem made—

> " 'To suit with time and place,
> A Gothic ruin and a Grecian house,
> A talk at college and of ladies' rights,
> A fuedal knight in silken masquerade.'

Other works of our poet are greater, but none is so fascinating. Some of the author's most delicately musical lines are herein contained. The tournament scene is the most vehement and rapid passage in the whole range of Tennyson's poetry. The songs reach the high water mark of lyrical compositions. The five melodies—*As Thro' the Land, Sweet and Low, The Splendor Falls, Home They Brought* and *Ask Me No More*—constitute the finest group of songs produced in our century, and the third seems to many the most perfect English lyric since the time of Shakespeare." The name of the Princess is Ida.

Priscilla (*pri-sil'ă*).—*Courtship of Miles Standish*, Longfellow. A Puritan maiden who is wooed by Captain Standish through the mediation of his friend, John Alden, who is in love with Priscilla. She prefers John Alden and marries him after the captain's supposed death. The captain, however, appears at the close of the wedding service, and the friends are reconciled.

Prometheus (*prō-mē'thūs*) **Bound.**—A tragedy of Æschylus, of uncertain date. Prometheus, is fabled to have made men of clay, and to have imparted life to them by means of fire brought from heaven. It was said that for this he was bound to the rock by order of Zeus, that he resisted all efforts to subdue his will and purpose, bade defiance to the father of the gods, and disappeared in an appalling tempest. Mrs. Browning published a poetical translation in 1833.

Prospero (*pros'pe-rō*).—*Tempest*, Shakespeare. Rightful duke of Milan, deposed by his brother. Drifted on a desert island, he practised magic, and raised a tempest in which his brother was shipwrecked. Ultimately Prospero "broke his wand," and his daughter married the son of the King of Naples.

Puff, Mr.—In Sheridan's farce *The Critic*, a hack writer, who, having failed at other occupations, tries criticism for a living, and is a "professor of the art of puffing."

Puss in Boots.—The subject and title of a wellknown nursery tale derived from a fairy story in the *Nights* of the Italian author Straparola, and Charles Perrault's *Contes des Fées*. The wonderful cat secures a princess and a fortune for his master, a poor young miller, whom he passes off as the rich marquis of Carabas.

Pygmalion (*pig-mā'li-on*) **and Galatea** (*gal-a-tē'ă*).—A mythological comedy, by W. S. Gilbert, embodying the fable of the Athenian sculptor who prayed the gods to put life into the statue of Galatea which he had fashioned. In the comedy, Galatea evokes the jealousy of the sculptor's wife Cynisca; and, after causing great misery by her very innocence, voluntarily returns to the original stone.

Pyncheon (*pin'chon*).—The name of an ancient but decayed family in Hawthorne's romance *The House of the Seven Gables*. There are: (1) Judge Pyncheon, a selfish, cunning, worldly man. (2) His cousin Clifford, a delicate, sensitive nature, reduced to childishness by long imprisonment and suffering. (3) Hepzibah, the latter's sister, an old maid who devotes herself to the care of Clifford. (4) A second cousin, Phœbe, a fresh, cheerful young girl, who restores the fallen fortunes of the family and removes the curse which rested on it.

Q

Quasimodo (*kwā-si-mō'dō*).—*Notre Dame de Paris*, Hugo. A misshapen dwarf, one of the prominent characters in the story. He is brought up in the cathedral of Notre Dame de Paris. One day, he sees Esmeralda, who had been dancing in the cathedral close, set upon by a mob, and he conceals her for a time in the church. When, at length, the beautiful gypsy girl is gibbeted, Quasimodo disappears mysteriously, but a skeleton corresponding to the deformed figure is found after a time in a hole under the gibbet.

Quaver.—*The Virgin Unmasked*, Fielding. A singing-master, who says, "if it were not for singing-masters, men and women might as well have been born dumb." He courts Lucy by promising to give her singing-lessons.

Queen Lab.—*Arabian Nights*. The queen of magic, ruler over the enchanted city, in the story of Beder, prince of Persia. She transforms men into horses, mules, and other animals. Beder marries her, defeats her plots against him, but is himself turned into an owl for a time.

Quentin Durward (*kwen'tin der'wărd*).—A novel by Sir Walter Scott. A story of French history. The delineations of Louis XI. and Charles the Bold of Burgundy will stand comparison with any in the whole range of fiction or history.

Quickly, Mistress.—*Merry Wives of Windsor*, Shakespeare. A serving woman to Dr. Caius, a French physician. She is the go-between of three suitors for "sweet Anne Page," and with perfect disinterestedness wishes all three to succeed.

Quickly, Mistress Nell.—Hostess of a tavern in Eastcheap, frequented by Harry, Prince of Wales, Sir John Falstaff, and all their disreputable crew.

Quidnunkis.—Title and name of hero in a fable found or written by Gay in 1726. This hero was a monkey which climbed higher than its neighbors, and fell into a river.

Quilp (*kwilp*).—*Old Curiosity Shop*, Dickens. A hideous dwarf, cunning, malicious, and a perfect master in tormenting. Of hard, forbidding features, with head and face large enough for a giant, he lived on Tower hill, collected rents, advanced money to seamen, and kept a sort of wharf, calling himself a ship-breaker.

Quintus Fixlein.—Title of a romance by Jean Paul Richter and the name of the principal character.

Quirk, Gammon, and Snap.—A firm of rascally, scheming, hypocritical solicitors in Warren's *Ten Thousand a Year*.

R

Raby, Aurora.—In Byron's *Don Juan*. She was a rich, noble English orphan, "a rose with all its sweetest leaves yet folded."

Radigund.—*Faërie Queene*, Spenser. Queen of the fabled Amazons. Having been rejected by Bellodant "the Bold," she revenged herself by degrading all the men who fell into her power by dressing them like women, and giving them women's work.

Ramayana [(*rä-mä'yä-nä*); *Rāma-ayana*, the goings or doings of Rama].—One of the two great epics of India, the other being the Mahabharata. It is ascribed to a poet, Valmiki, and consists at present of about twenty-four thousand stanzas, divided into seven books. It is the production of one man, though many parts are later additions, such as those in which Rama is represented as an incarnation of Vishnu, all the episodes in the first book, and the whole of the seventh. It was at first handed down orally, and variously modified in transmission, and afterward reduced to writing.

Ramona (*ra-mō'nă*).—Title of a romance by Helen Hunt Jackson. Ramona saw the American Indian followed by "civilization" while retreating slowly but surely toward his own extinction, and had herself a share in the tragedy. Ramona is considered the great romance of Indian life.

Random (*ran'dom*).—*Roderick Random*, Smollett. A young Scotch scapegrace in quest of fortune. At one time he revels in prosperity, again he is in utter destitution. He roams at random, in keeping with his name.

Rappaccini (*rap-ä-chē'nē*).—*Mosses from an Old Manse*, Hawthorne. A doctor in whose garden grew strange plants whose juices and fragrance were poison. His daughter, nourished on these odors, became poisonous herself. Her lover found an antidote which she took, but the poison meant life and the antidote meant death to her.

Rasselas (*ras'e-las*).—An imaginary romance by Dr. Johnson. According to the custom of his country, Abyssinia, Rasselas was confined in paradise, with the rest of the royal family. This paradise was in the valley of Amhara, surrounded by high mountains. It had only one entrance, a cavern concealed by woods, and closed by iron gates. He escaped with his sister Nekayah and Imlac the poet, and wandered about to find what condition or rank of life was the most happy. After investigation, he found no lot without its drawbacks, and resolved to return to the "Happy Valley."

Raud the Strong.—*Tales of a Wayside Inn*, Henry W. Longfellow. The viking who worshiped the old gods and lived by fire and sword. King Olaf went against him, sailing from Drontheim to Salten Fjord.

Raven, The.—A poem by Edgar Allan Poe, published in 1845, which has attained a world-wide popularity. For the author's account of the mode of its construction, see *The Philosophy of Composition*, an essay, in the collected edition of his works. The last verse runs:

> And the Raven, never flitting, still is sitting, still is sitting,
> On the pallid bust of Pallas, just above my chamber door;
> And his eyes have all the seeming of a demon's that is dreaming,
> And the lamplight o'er him streaming throws his shadow on the floor;
> And my soul from out that shadow that lies floating on the floor
> Shall be lifted—Nevermore!

Ravenswood.—*Bride of Lammermoor*, Scott. The lord of Ravenswood, an old Scotch nobleman and a decayed royalist. His son Edgar falls in love with Lucy Ashton, daughter of Sir William Ashton, Lord-Keeper of Scotland. The lovers plight their troth, but Lucy is compelled to marry Frank Hayston, laird of Bucklaw. The bride, in a fit of insanity, attempts to murder the bridegroom and dies. Bucklaw goes abroad. Colonel Ashton, seeing Edgar at the funeral of Lucy, appoints a hostile meeting; and Edgar, on his way to the place appointed, is lost in the quicksands. A prophecy, noted as a curse, hung over the family and was thus fulfilled.

Raymond.—In *Jerusalem Delivered*, by Tasso. Raymond was known as the Nestor of the crusaders, slew Aladine, the king of Jerusalem, and planted the Christian standard upon the tower of David.

Rebecca.—*Ivanhoe*, Scott. Daughter of Isaac the Jew, in love with Ivanhoe.

Red-cross Knight.—The Red-cross Knight is St. George, the patron saint of England, and, in the obvious and general interpretation, typifies holiness, or the perfection of the spiritual man in religion. In Spenser's *Faërie Queene* the task of slaying a dragon was assigned to him as the champion of Una.

Redgauntlet (*red-gänt'let*).—One of the principal characters in Sir Walter Scott's novel of the same name, a political enthusiast and Jacobite, who scruples at no means of upholding the cause of the Pretender and finally accompanies him into exile. His race bore a fatal mark resembling a horseshoe which appeared on the face of Red-gauntlet as he frowned when angry.

Red-Riding-Hood.—This nursery tale is, with slight variations, common to Sweden, Germany, and France. In Charles Perrault's *Contes des Fées* it is called *Le Petit Chaperon Rouge*.

Religio Medici (*rē-lij'i-ō med'i-sī*).—A prose work by Sir Thomas Browne. "*The Religio Medici*," says the elder Lytton, "is one of the most beautiful prose poems in the language; its power of diction, its subtlety and largeness of thought, its exquisite conceits and images, have no parallel out of the writers of that brilliant age when Poetry and Prose had not yet divided their domain, and the Lyceum of Philosophy was watered by the mixing of the wine!"

Representative Men.—A work by Emerson which more nearly than any of his other works, gives expression to his system as a whole. The topics are: (1) Plato, the Philosopher; (2) Swedenborg, the Mystic; (3) Montaigne, the Skeptic; (4) Shakespeare, the Poet; (5) Napoleon, the Man of the World; (6) Goethe, the Writer. The mental portraits sketched under these six heads give us Emerson himself, so far as he is capable of being formulated at all.

Republic, The.—A work composed by Plato four hundred years before Christ. *The Republic* is not, as the title would suggest, a political work, like the *Politics* of Aristotle. The principles and government of an ideal moral organism, of which the rulers shall be types of fully developed and perfectly educated men, are the real subject. In the *Republic* we find the necessity of virtue to the very idea of social life proved in the first book; then the whole process of a complete moral and scientific education is set forth. It has been said that the most complete record of the beliefs or opinions of Plato are found in this work.

Reveries of a Bachelor.—By D. G. Mitchell. The *Reveries* is a collection of sketches of life and character, painted in such a dreamlike, delicate manner as to make the reader lose for the time being the full consciousness of his surroundings. It has called forth a number of imitators more or less successful, no one of whom, however, is comparable to the original.

Reynard (*rā'närd*, or *ren'ärd*) **the Fox.**—A beast-epic, so called. This prose poem is a satire on the state of Germany in the middle ages. Reynard represents the Church; Isengrin the wolf (his uncle) typifies the baronial element; and Nodel the lion stands for the regal power. The plot turns on the struggle for supremacy between Reynard and Isengrin. Reynard uses all his endeavors to victimize everyone, especially his uncle Isengrin, and generally succeeds.

Richelieu (*rēsh-y-lōō'*), or *The Conspiracy.*—A drama in five acts, by Edward, Lord Lytton; produced in 1839, the part of the hero being played by Macready. For some of the incidents the author confesses himself indebted to the authors of *Cinq Mars* and *Picciola*. Among the characters are Baradas, the favorite; De Mauprat, in love with Julie; Julie de Mortemar herself; Marion de Lorme, mistress of Orleans; Orleans himself; Louis XIII., and others.

Rights of Man, The.—"Being an answer to Mr. Burke's Attack on the French Revolution," by Thomas Paine. This work, which was published in 1791-1792, procured for the writer the distinction of a trial for sedition, which he escaped by flying to France.

Rinaldo (*ri-nal'dō*).—A Christian hero in Tasso's *Jerusalem Delivered*. He was the son of Bertoldo and Sophia, and nephew of Guelpho, but was brought up by Matilda. He was one of Charlemagne's paladins, and cousin to Orlando. Having killed Charlemagne's nephew Berthelot, he was banished and outlawed. After various adventures and disasters, he went to the Holy Land, and, on his return, succeeded in making peace with the emperor.

Ring and the Book, The.—A poem by Robert Browning, published in 1869. It is the story of a tragedy which took place at Rome in 1698. The versified narrative of the child Pompilia's sale to Count Guido, of his cruelty and violence, of her rescue by a young priest, the pursuit, the lawful separation, the murder by Guido of the girl and her putative parents, the trial and condemnation of the murderer, and the affirmation of his sentence by the pope—all this is made to fill out a poem of twenty-one thousand lines; but these include ten different versions of the tale, besides the poet's prelude, in which latter he gives a general outline of it. The chapters which contain the statements of the priest lover and Pompilia are full of tragic beauty and emotion. The pope's soliloquy, though too prolonged, is a wonderful piece of literary metempsychosis.

Rip Van Winkle.—A tale by Washington Irving, adapted from the old German legend of Peter Klaus, a goatherd, who drank a miraculous draught of wine in a dell of the Harz mountains, which brought on sleep from which he did not wake until twenty years after, when he returned to his native village to find everything changed, and no one who knew him. In Irving's tale the hero is a Dutchman living in America, and the scene is the Catskill mountains. The story is most picturesquely told, and has been effectively dramatized, the leading personage being illustrated by the genius of Jefferson.

Rivals, The.—A comedy by Richard Brinsley Sheridan, produced at Covent Garden, London, in 1775, and described by Hazlitt as "a play of even more action and incident, but of less wit and satire, than *The School for Scandal*. It is as good as a novel in the reading, and has the broadest and most palpable effect upon the stage."

Roaring Camp, The Luck of.—A prose sketch by Francis Bret Harte, an American poet, in which the softening effects of the presence of a little child in a camp of ruffians are very touchingly described. It has been dramatized.

Rob Roy.—A romance by Sir Walter Scott which is founded on some passages in the career of the famous Highlander, Robert MacGregor, who was popularly

called Rob Roy. The nominal hero of *Rob Roy* is Francis Osbaldistone; the heroine, Diana Vernon. Among the other characters are Baillie Nicol Jarvie, 'The Dougal Cratur" Andrew Fairservice, Helen MacGregor, Sir Frederick Vernon, and Rashleigh Osbaldistone. The novel has been dramatized in a version which still holds the stage in Scotland. Scott speaks of Rob as "the Robin Hood of Scotland—the dread of the wealthy, but the friend of the poor, and possessed of many qualities, both of head and heart, which would have graced a less equivocal profession than that to which his fate condemned him."

Roderick, or **Roderic** (*rod'er-ik*) **Dhu.**—*Lady of the Lake,* Scott. An outlaw and chief of a band of Scots who resolved to win back what had been lost to the Saxons. In connection with Red Murdock he sought the life of the Saxon Fitz-James.

Roderigo (*rod-e-rē'gō*).—In Shakespeare's *Othello,* a Venetian in love with Desdemona, who, when the lady eloped with Othello, hated the "noble Moor."

Roland (*rō'land*).—The hero of one of the most ancient and popular epics of early French or Frankish literature, and, according to tradition, the favorite nephew and captain of the Emperor Charlemagne. Roland is the hero of Théroulde's *Chanson de Roland,* of Turpin's *Chronique;* of Bojardo's *Orlando Innamorato;* of Ariosto's *Orlando Furioso.*

Romance of the Rose.—A poetical allegory, begun by Guillaume de Lorris in the latter part of the thirteenth century, and continued by Jean Meung in the first half of the fourteenth century. The poet dreams that Dame Idleness conducts him to the Palace of Pleasure, where he meets many adventures among the attendant maidens, Youth, Joy, Courtesy, and others, by whom he is conducted to a bed of roses. He singles out one, when an arrow from Love's bow stretches him fainting on the ground. Fear, Slander, and Jealousy are afterward introduced.

Romeo.—In Shakespeare's tragedy of *Romeo and Juliet,* a son of Montague, in love with Juliet, the daughter of Capulet, who was the head of a noble house of Verona, in feudal enmity with the house of Montague.

Romeo and Juliet.—A tragedy by William Shakespeare. Romeo, a son of Montague, in love with Juliet, the daughter of Capulet; but between the houses of Montague and Capulet there existed a deadly feud. As the families were irreconcilable, Juliet took a sleeping draught, that she might get away from her parents and elope with Romeo. Romeo, thinking her to be dead, killed himself; and when Juliet awoke and found her lover dead, she also killed herself.

Romola (*rom'ō-lā*).—A novel of Italian life and character by George Eliot. *Romola* is a marvelously able story of the revival of the taste and beauty and freedom of Hellenic manners and letters, under Lorenzo de' Medici and the scholars of his court, side by side with the revival of Roman virtue, and more than the ancient austerity and piety, under the great Dominican Savonarola. This period of history is one which of all others may well have engrossing interest for George Eliot. Treasures of learning and discipline, amassed for mankind ages before, for ages stored and hidden away, see again the sun, are recognized and put to use. What use they will be put to, with what new and fruitful effects on the state and the citizen, with what momentary and with what lasting consequences, this she strives to discover; this she follows through the public history of Italy during the modern invasion of Charles VIII., and the events which succeed his invasion, and through the private fortunes of her admirably chosen group of characters, some of them drawn from life, all of them true to nature.

Rosetta (*rō-zet'tä*) **Stone.**—Found at Rosetta in the delta of the Nile, contains equivalent inscriptions in hieroglyphics in demotic and in Greek letters. The meaning of the Greek text being known, the hieroglyphics could be translated.

Rowena (*rō-ē'nä*).—A Saxon princess, ward of Cedric of Rotherwood, in Sir Walter Scott's romance of *Ivanhoe.*

Rumpelstilzchen.—*Old German Tales.* According to Grimm, this name is a compound, but the spirit represented is one familiar to all German children. The original story tells of him as a dwarf who spun straw into gold for a certain miller's daughter.

S

Sacripant (*sak'ri-pant*), **King.**—(1) King of Circassia, and a lover of Angelica, in Bojordo and Ariosto. (2) A personage in Tassoni's mock heroic poem, *Rape of the Bucket,* represented as false, brave, noisy and hectoring.

Sagas (*sä'gas*).—Title of the ancient traditions which form the substance of the history and mythology of the Scandinavian races. The language in which they are written is supposed to be the old Icelandic. In the *Edda* there are numerous sagas. As our Bible contains the history of the Jews, religious songs, moral proverbs, and religious stories, so the *Edda* contains the history of Norway, religious songs, a book of proverbs, and numerous stories. The original *Edda* was compiled and edited by Sæmund Sigfusson, an Icelandic priest and scald, in the eleventh century. It contains twenty-eight parts or books, all of which are in verse. Two hundred years later Snorri Sturleson, of Iceland, abridged, rearranged, and reduced to prose the *Edda,* and his work was called *The Younger Edda.* In this we find the famous story called by the Germans the *Nibelungenlied.* Besides the sagas contained in the *Eddas,* there are numerous others, and the whole saga literature makes over two hundred volumes. Among them are the *Völsunga Saga,* which is a collection of lays about the early Teutonic heroes. The *Saga of St. Olaf* is the history of this Norwegian king. *Frithjof's Saga* contains the life and adventures of Frithjof of Iceland. Snorri Sturleson, at the close of the twelfth century, made the second great collection of chronicles in verse, called the *Heimskringla Saga.* This is a most valuable record of the laws, customs and manners of the ancient Scandinavians.

Sakuntala.—A famous drama by Kâlidasa. The daughter of Viswamita and a water nymph, abandoned by her parents, and brought up by a hermit. One day, King Dushyanta came to the hermitage, and persuaded Sakuntala to marry him. In due time a son was born, but Dushyanta left his bride at the hermitage. When the boy was six years old, his mother took him to the king, and Dushyanta recognized his wife by a ring which he had given her. Sakuntala was now publicly proclaimed queen, and the boy (whose name was Bhârata) became the founder of the glorious race of the Bhâratas.

Samson Agonistes (*sam'son ag-o-nis'tēz*).—A sacred drama by Milton. Samson, blind and bound, triumphs over his enemies. As in the Bible story, he grasps two of the supporting pillars, and perishes in the general ruin.

Sancho Panza (*sang'kō pan'zä*).—The esquire and counterpart of Don Quixote in Cervantes' famous novel. He has much shrewdness in practical matters, and a store of proverbial wisdom. He rode upon an ass and was noted for his proverbs.

Sartor Resartus (*sär'tor rē-sär'tus*), (*i. e., The Tailor Patched*).—The title of an old Scottish ballad, being *The Life and Opinions of Herr Teufelsdröckh, in Three Books,* by Thomas Carlyle. In may be described as a kind of philosophical romance, in which the author gives us, in the form of a review of a supposed German work on dress, and a notice of the writer, his opinions on things in general. The hero, it has been said, seems to be intended for a portraiture of human nature as affected by the moral influence to which a cultivated mind would be exposed by acquaintance with the transcendental philosophy of Fichte.

Satyrane (*sat'i-rān*), **Sir.**—*Faërie Queene,* Spenser. A noble knight who delivered Una from the fauns and satyrs. The meaning seems to be that Truth, driven from the towns and cities, took refuge in caves and dens where for a time it lay concealed. At length Sir Satyrane (Luther) rescues Una from bondage; but no sooner is this the case than she falls in with Archimago, to show how very difficult it was at the time of the Reformation to separate Truth from Error.

Sawyer, Bob.—*Pickwick Papers,* Dickens. A drinking young doctor who tries to establish a practice at Bristol, but without success. Sam Weller calls him "Mr. Sawbones."

Scalds, or **Skalds.**—Court poets and chroniclers of the ancient Scandinavians. They resided at court, were attached to the royal suite, and attended the king in all his wars. These bards celebrated in song the gods, the kings of Norway, and national heroes. Few complete Skaldic poems have survived, but a multitude of fragments exist.

Scarlet Letter, The.—A romance by Nathaniel Hawthorne, published in 1850. The heroine, Hester Prynne, was condemned to wear conspicuously the letter "A" in scarlet, token of her sin as mother of her child, Pearl, whose father was not known. She was first exposed in disgrace on a raised scaffold, then served a term in prison, and afterward gained a moderate support for herself and child by embroidering. She refused to reveal the name of the father, although she might then be allowed to lay aside the letter. He was always near, held an important position, and lived a life of wearing remorse. After his death Hester Prynne took her child to another country, but returned to spend her old age in seclusion and com-

fort in the same place that had witnessed her punishment. She always bore herself proudly, but not defiantly, and brought to herself such love and respect that the scarlet letter became a badge of honor. Roger Chillingworth, Hester's husband, appeared as a learned foreign physician, visited her in prison, but promised not to reveal his relation to her, and devoted his life to learning her secret. The characters in the story are intense, and the analysis of motives subtle.

Scheherazade, or **Sheherazade** (*she-hĕ'rā-zād'*).—*Arabian Nights.* The fabled relater of the stories in these "Entertainments."

Scaramouche (*skar'a-mouch*).—An Italian character whose traits are cowardice and boastfulness. He is of Spanish creation, copied into Italian comedy.

Schlemihl (*shlem'el*), **Peter.**—The name of the hero of a little work by Chamisso, a man who sells his shadow to the devil. The name has become a byword for any poor, silly, and unfortunate fellow.

Schneider (*shnī'der*).—Rip Van Winkle's dog, in Boucicault's dramatization of Irving's *Rip Van Winkle.* The name of the dog in the story is "Wolf."

School for Scandal, The.—A comedy by Richard Brinsley Sheridan, produced at Covent Garden, London, in 1777, and characterized by Hazlitt as, "if not the most original, perhaps the most finished and faultless comedy which we have. The scene in which Charles Surface sells all the old family pictures but his uncle's, who is the purchaser in disguise, and that of the discovery of Lady Teazle when the screen falls, are among the happiest and most highly wrought that comedy, in its wide and brilliant range, can boast. Besides the art and ingenuity of this play, there is a genial spirit of frankness and generosity that relieves the heart as well as clears the lungs. While it strips off the mask of hypocrisy, it inspires a confidence between man and man."

School for Wives [*L'Ecole des Femmes* (*lā-kol' dā fam'*)].—A comedy by Molière. Arnolph has a crotchet about the proper training of girls to make good wives, and tries his scheme upon Agnes, whom he adopts from a peasant's cottage, and designs in due time to make his wife. He sends her from early childhood to a convent, where difference of sex and the conventions of society are wholly ignored. When removed from the convent, she treats men as if they were schoolgirls, kisses them, plays with them, and treats them with girlish familiarity. The consequence is, a young man name Horace falls in love with her, and makes her his wife, and Arnolph loses his painstaking.

School of Husbands [*L'Ecole des Maris* (*lā-kol' da mā-re'*)] A comedy by Molière. Ariste and Sganarelle, two brothers, bring up Léonor and Isabelle, two orphan sisters, according to their systems for making them in time their model wives. Sganarelle's system was to make the woman dress plainly, live retired, attend to domestic duties, and have few indulgences. Ariste's system was to give the woman great liberty, and trust to her honor. Isabelle, brought up by Sganarelle, deceived him and married another; but Léonor, brought up by Ariste, made him a fond and faithful wife.

Scottish Chiefs, The.—A romantic story by Jane Porter, published in 1810, and counting among its heroes Robert Bruce and Sir William Wallace.

Scourge of God.—Attila, king of the Huns. A. P. Stanley says the term was first applied to Attila in the Hungarian *Chronicles.* It is found in a legend belonging to the eighth or ninth century.

Scrooge (*skrōj*), **Ebenezer.**—*Christmas Carol,* Dickens. The prominent character, made partner, executor, and heir of old Jacob Marley, stockbroker.

Seasons, The.—A series of poems by James Thomson, which appeared in the following order: *Winter; Summer; Spring;* and *Autumn;* the whole being republished, with the famous *Hymn.* Horace Walpole said that he would rather have written the most absurd lines by Lee than *The Seasons;* but Wordsworth, on the other hand, speaks of it as "a work of inspiration. Much of it," he says, "is written from himself, and nobly from himself."

Sebastian (*se-bas'tian*).—(1) Brother of Viola, in *Twelfth Night.* They were twins, and so much alike that they could not be distinguished except by their dress. Sebastian and his sister being shipwrecked, escaped to Illyria. Here Sebastian was mistaken for his sister (who had assumed man's apparel), and was invited by the Countess Olivia to take shelter in her house from a street broil. Olivia was in love with Viola, and thinking Sebastian to be the object of her love, married him. (2) Brother of Alfonso, king of Naples, in *The Tempest.* (3) Father of Valentine and Alice, in Beaumont and Fletcher's *Mons. Thomas.*

Sedley, Mr.—*Vanity Fair,* Thackeray. A wealthy London stockbroker, brought to ruin in the money market just prior to the battle of Waterloo.

Selith.—One of the two guardian angels of the Virgin Mary and St. John the divine, in Klopstock's *Messiah.*

Sempronius (*sem-prō'ni-us*).—In Shakespeare's *Timon of Athens,* a flatterer of Timon, who excuses himself from lending Timon money on the ground that others had been asked first.

Senena,—*Madoc,* Southey. A Welsh maiden in love with Caradoc. Under the assumed name of Mervyn she became the page of the Princess Goervyl, that she might follow her lover to America, where Madoc colonized Caer-Madoc. Senena was promised in marriage to another; but when the wedding day arrived the bride was nowhere to be found.

Sentimental Journey Through France and Italy.—By Laurence Sterne, published in 1768. Sterne describes this work as follows: "It is a subject which works well, and suits the frame of mind in which I have been for some time past. I told you my design in it was to teach us to love the world and our fellow creatures better than we do—so it runs most upon these gentler passions and affections which add so much to it."

Serena (*sā-rā'nā*).—*Faërie Queene,* Spenser. Allured into the fields by the mildness of the weather, to gather wild flowers for a garland, she was attacked by the Blatant Beast, which carried her off in its mouth. Her cries attracted to the spot Sir Calidore, who compelled the beast to drop its prey.

Sesame.—In Arabian tales given as the talismanic word which would open or shut the door leading into the cave of the forty thieves. In order to open it, the words to be uttered were, "Open, Sesame!" and in order to close it, "Shut, Sesame!" Sesame is a plant yielding grain which is sometimes used for food, and from which an oil is expressed. When Cassim forgot the word, he substituted "Barley," but without effect. Sesame has come into general use in connection with any word or act which will open the way for accomplishment of the thing desired.

Seven Lamps of Architecture, The.—A treatise on architecture by Ruskin, published in 1849. The "seven lamps" are those of Sacrifice, Truth, Power, Beauty, Life, Memory, and Obedience. They are symbolic rules for the guidance of the student.

Sganarelle (*sgă-nă-rel'*).—The hero of Molière's comedy *La Mariage Force.* He is represented as a humorist of about fifty-three, who, having a mind to marry a fashionable young woman, but feeling a doubt, consults his friends upon this momentous question. Receiving no satisfactory counsel, and not much pleased with the proceedings of his bride elect, he at last determines to give up his engagement, but is cudgeled into compliance by the brother of his intended.

Shallow.—A braggart and absurd country justice in Shakespeare's *Merry Wives of Windsor,* and in the second part of *King Henry IV.*

Shandy, Mrs.—The mother of Tristram Shandy in Sterne's novel of this name. She is the ideal of nonentity, a character individual from its very absence of individuality.

Shandy, Tristram.—The nominal hero of Sterne's *The Life and Opinions of Tristram Shandy, Gent.*

Shandy, Walter.—The name of Tristram Shandy's father in Sterne's novel of this name, a man of an active and metaphysical, but at the same time a whimsical, cast of mind, whom too much and too miscellaneous learning had brought within a step or two of madness.

Sharp, Becky.—A leading character in Thackeray's *Vanity Fair,* the daughter of a poor painter, dashing, selfish, unprincipled, and very clever.

Shepherd of Salisbury Plain, The.—The hero and title of a religious tract by Hannah More. The shepherd is noted for his homely wisdom and simple piety.

Shepherd's Calendar, The.—Twelve eclogues in various meters, by Spenser, one for each month. January: Colin Clout (Spenser) bewails that Rosalind does not return his love. February: Cuddy, a lad, complains of the cold, and Thenot laments the degeneracy of pastoral life. March: Willie and Thomalin discourse of love. April: Hobbinol sings a song on Eliza. May: Palinode exhorts Piers to join the festivities of May, but Piers replies that good shepherds who seek their own indulgence expose their flocks to the wolves. June: Hobbinol exhorts Colin to greater cheerfulness. July: Morrel, a goatherd, invites Thomalin to come with him to the uplands. August: Perigot and Willie contend in song, and Cuddy is appointed arbiter. September: Diggon Davie complains to Hobbinol of clerical abuses. October: On poetry. November: Colin being asked by Thenot to sing, excuses himself because of his grief for Dido, but finally sings her elegy. December: Colin again

complains that his heart is desolate. Thenot is an old shepherd bent with age, who tells Cuddy, the herdsman's boy, the fable of the oak and the brier, one of the best-known fables included in the calendar.

Shepherd's Pipe.—Pan, in Greek mythology, was the god of forests, pastures, and flocks, and the reputed inventor of the shepherd's flute or pipe.

Sheridan's Ride.—A lyric by T. B. Read, one of the few things written during the heat of the Civil war that is likely to survive.

She Stoops to Conquer.—A comedy by Oliver Goldsmith, said to have been founded on an incident which actually occurred to its author. When Goldsmith was sixteen years of age, a wag residing at Ardagh directed him, when passing through that village, to Squire Fetherstone's house as the village inn. The mistake was not discovered for some time, but all concerned enjoyed the joke. *She Stoops to Conquer* is one of the gayest, pleasantest, and most amusing pieces of English comedy.

Shingebis.—In Longfellow's *Hiawatha*, the diver who challenged the North Wind and put him to flight in combat.

Shocky.—*The Hoosier Schoolmaster*, Edw. Eggleston. The little lad from the poorhouse who adores the schoolmaster and early warns him of plans for upsetting his authority. He is also a small poet, not in rhyming, but in comprehension of things about him and in his way of looking at life, and he grows to be a helper in the *Church of the Best Licks*, founded by the schoolmaster.

Shylock.—A sordid, avaricious, revengeful Jew, in Shakespeare's *Merchant of Venice*.

Siege Perilous, The.—The Round Table contained sieges, or seats, in the names of different knights. One was reserved for him who was destined to attainment in the quest of the Holy Grail. This seat was called "perilous" because if anyone sat therein except he for whom it was reserved, he would "lose himself." It finally bore the name of Sir Galahad.

Siegfried (*sēg'frēd*).—The hero of various Scandinavian and Teutonic legends, particularly of the old German epic poem, the *Nibelungenlied*. He is represented as a young warrior of physical strength and beauty, and in valor superior to all men of his time. He cannot easily be identified with any historical personage.

Sikes, Bill.—A brutal thief and housebreaker in Dickens' novel *Oliver Twist*. He murders his mistress, Nancy, and, in trying to lower himself by a rope from the roof of a building where he had taken refuge from the crowd, he falls, and is choked in a noose of his own making. Sikes had an ill-conditioned, savage dog, the beast-image of his master, which he kicked and loved, ill-treated and fondled.

Silas Marner (*mär'ner*).—A novel by George Eliot, published in 1861. This novel is one of the authoress' most beautiful stories, the most poetical of them all—the tale of Silas Marner, who deems himself deserted and rejected utterly of God and man, and to whom, in his deepest misery, in place of lost gold, a little foundling girl is sent. This tale is the most hopeful of all her books. The contemplation of the renewal of enterprise and energy, which comes with little children, and of the promise with which each new generation gilds the crown of honor for its sires, is pleasant and grateful to her. She writes upon her title page the lines of Wordsworth:

> A child, more than all other gifts
> That earth can offer to declining man,
> Brings hope with it and forward-looking thoughts.

The weaver of Raveloe and Eppie are creations after Wordsworth's own heart.

Silken Thread.—*Gulliver's Travels*. In the kingdom of Lilliput, the three great prizes of honor are "fine silk threads six inches long, one blue, another red, and a third green." The thread is girt about the loins, and no ribbon of the Legion of Honor, or of the Knight of the Garter, is worn more worthily or more proudly.

Sindbad (*sind'bad*) **the Sailor.**—A character in the *Arabian Nights*, in which is related the story of his strange voyages and wonderful adventures.

Sinon.—In Vergil's *Æneid* the cunning Greek who, by a false tale, induced the Trojans to drag the wooden horse into Troy.

Sir Roger de Coverley (*kuv'er-li*).—In Addison's *The Spectator*. The prototype of this famous character was Sir John Pakington, a hypothetical baronet of Coverley or Cowley, near Oxford.

Skeleton in Armor, The.—A lyric by Henry Wadsworth Longfellow, suggested to him while riding on the seashore at Newport. A year or two previous a skeleton had been dug up at Fall River, clad in broken and corroded armor; and the idea occurred to him of connecting it with the Round Tower at Newport, generally known hitherto as the Old Windmill, though now claimed by the Danes as a work of their early ancestors.

Sketch-Book, The.—A series of short tales, sketches, and essays, published by Washington Irving in 1820. They are chiefly descriptive of English manners and scenery, and have often been reprinted.

Skylark, Ode to the.—By Percy Bysshe Shelley, written in 1820. "In sweetness," says Leigh Hunt, "and not even there in passages, the *Ode to the Skylark* is inferior only to Coleridge—in rapturous passion to no man. It is like the bird it sings—enchanting, profuse, continuous, and alone; small, but filling the heavens."

> Hail to thee, blithe spirit!
> Bird thou never wert,
> That, from heaven, or near it,
> Pourest thy full heart
> In profuse strains of unpremeditated art.

Slick, Sam.—The hero of various humorous narratives, by Haliburton, illustrating and exaggerating the peculiarities of the Yankee character and dialect.

Slop, Dr.—The name of a choleric and uncharitable physician in Sterne's *Tristram Shandy, Gent.*

Slough of Despond.—*Pilgrim's Progress*, Bunyan. A deep bog, which Christian had to pass on his way to the Wicket Gate.

Sly, Christopher.—*Taming of the Shrew*, Shakespeare. A keeper of bears and a tinker and a sad drinker, son of a peddler.

Sofronia (*sof-rō'ni-ä*).—A young Christian of Jerusalem, the heroine of an episode in Tasso's *Jerusalem Delivered*. She and her lover, Olinda, are condemned to death by Aladine, king of Jerusalem. The king finally, at the solicitation of Clorinda, spares them and they are married.

Sohrab (*sō-hrāb'*) **and Rustum.**—An episode, or narrative in verse, by Matthew Arnold. The story is told in prose in Sir John Malcolm's *History of Persia*. "The powerful conception of the relation between the two chieftains, and the slaying of the son by the father, are," says Stedman, "tragical and heroic. The descriptive passage at the close beginning—

> But the majestic river floated on,

for diction and breadth of tone would do honor to any living poet."

Song of Roland.—An ancient song recounting the deeds of Roland, the renowned nephew of Charlemagne, slain in the pass of Roncesvalles. At the battle of Hastings, Taillefer advanced on horseback before the invading army, and gave the signal for onset by singing this famous song.

Spanker, Lady Gay.—In *London Assurance*, by Boucicault, is a woman of great spirit, devoted to the chase.

Speed.—An inveterate punster and the clownish servant of Valentine, one of the two "gentlemen" in Shakespeare's *The Two Gentlemen of Verona*.

Spenlow (*spen'lō*).—*Lavinia* and *Clarissa*, in Dickens' *David Copperfield*, two spinster aunts of Dora Spenlow, with whom she lived at the death of her father.

Squeers.—Name of a family prominent in Dickens' *Nicholas Nickleby*. Wackford Squeers, master of Dotheboys Hall, in Yorkshire, is a vulgar, conceited, ignorant schoolmaster, overbearing and mean. He steals the boys' pocket money, clothes his son in their best suits, half starves them, and teaches them next to nothing. Ultimately he is transported for theft. Mrs. Squeers, a raw-boned, harsh, heartless virago, with no womanly feeling for the boys put under her charge. Miss Fanny Squeers, daughter of the schoolmaster. Miss Fanny falls in love with Nicholas Nickleby, but later hates him because he is insensible to the soft impeachment. Master Wackford Squeers, over-bearing, self-willed and passionate.

Squire of Dames.—A personage introduced by Spenser in the *Faërie Queene*, and whose curious adventures are there recorded. The expression is sometimes applied to a person devoted to the fair sex.

Steerforth (*stēr'fōrth*), **James.**—*David Copperfield*, Dickens. The young man who led little Em'ly astray. When tired of his toy, he proposed to her to marry his valet. Steerforth, being shipwrecked off the coast of Yarmouth, Ham Peggotty tried to rescue him, but both were drowned.

Stentor (*sten'tor*).—A Grecian herald in the Trojan war whom Homer describes as great-hearted, brazen-voiced Stentor, accustomed to shout as loud as fifty other men.

Stephano (*stef'a-nō*).—(1) In Tasso's *Jerusalem Delivered*, earl of Carnuti, the leader of four hundred men in the allied Christian army. He was noted for his military prowess and wise counsel; (2) a drunken butler in Shakespeare's *The Tempest;* (3) servant to Portia in Shakespeare's *Merchant of Venice*.

Stiggins, Rev. Mr.—A red-nosed, hypocritical "shepherd," or Methodist parson, in Dickens' *Pickwick Papers*, with a great appetite for pineapple rum. He is the spiritual adviser of Mrs. Weller, and lectures on temperance.

Strephon (*stref'on*).—The shepherd in Sir Philip Sidney's *Arcadia*, who makes love to the beautiful Urania. It is a stock name for a lover, Chloe being usually the corresponding lady.

Strongback.—One of the seven attendants of Fortunio, in D'Aulnoy's *Fairy Tales*. He could never be overweighted, and could fell a forest in a few hours without fatigue.

Summer, St. Martin's.—The fine weather which generally occurs in October and November; referred to in *Henry VI.*

T

Tabard (*tab'ărd*), **The.**—Is the inn, in High Street, Southwark, London, from which Chaucer makes his pilgrims start on their journey to Canterbury. It took its name from its sign—a tabard.

Tale of Two Cities, A.—A novel, by Charles Dickens, originally produced in *All the Year Round* for 1859, and afterward republished in complete form. The author says he first conceived the main idea of the story when acting, with his children and friends, in Wilkie Collins' drama of *The Frozen Deep*. His narrative is drawn from the scenes of the French revolution of 1789; and it was one of Dickens' hopes, he says, to add something to the popular and picturesque means of understanding that terrible time; "though no one," he continues, "can hope to add anything to the philosophy of Carlyle's wonderful book."

Tales of a Wayside Inn.—Name given by Longfellow to a collection of short poems arranged by himself and collected together much in the same form as Chaucer's *Canterbury Tales*. These "tales" were mostly gathered from old literature and translated into Longfellow's own verses—only one, *The Birds of Killingworth*, being said to be entirely original. Seven narratives are represented: the Landlord, the Student, the Spanish Cavalier, the Jew, the Sicilian, the Musician, and the Theologian. Four colonial tales are included in the work: *Paul Revere's Ride*, *Elizabeth*, *Lady Wentworth*, and *The Rhyme of Sir Christopher*.

Taming of the Shrew, The.—A comedy by Shakespeare. The incident of Vincentio's personation by the pedant was borrowed by Shakespeare from George Gascoigne's *Supposes*. The chief characters are Petruchio and his wife Katharine, the shrew.

Tam O'Shanter.—The title of a poem by Burns, and the name of its hero, a farmer, who, riding home very late and very drunk from Ayr, in a stormy night, had to pass by the kirk of Alloway, a place reputed to be a favorite haunt of the devil and his friends and emissaries. On approaching the kirk, he perceived a light gleaming through the windows; but, having got courageously drunk, he ventured on till he could look into the edifice, when he saw a dance of witches. His presence became known, and in an instant all was dark; and Tam, recollecting himself, turned and spurred his horse to the top of her speed, chased by the whole fiendish crew. It is a current belief that witches, or any evil spirits, have no power to follow a poor wight any farther than the middle of the next running stream. Fortunately for Tam, the River Doon was near, and he escaped, while the witches wield only the tail of his mare Maggie. It has been said of *Tam O'Shanter* that in no other poem of the same length can there be found so much brilliant description, pathos, and quaint humor, nor such a combination of the terrific and the ludicrous.

Tancred (*tang'kred*).—In Tasso's *Jerusalem Delivered*, was the greatest of all the Christian warriors, except Rinaldo.

Tartufe, or **Tartuffe** (*tär-tüf'*).—One of Molière's best known comedies. Tartuffe is a religious hypocrite and impostor, who uses "religion" as the means of gaining money, covering deceit, and promoting self-indulgence. He is taken up by one Orgon, a man of property, who promises him his daughter in marriage; but, his true character being exposed, he is not only turned out of the house, but is lodged in jail for felony.

Isaac Bickerstaff adapted Molière's comedy to the English stage, under the title of *The Hypocrite*. Tartuffe he calls "Dr. Cantwell," and Orgon "Sir John Lambert." It is thought that "Tartuffe" is a caricature of Père la Chaise, the confessor of Louis XIV., who was very fond of truffles (French, *truffes*), and that this suggested the name to the dramatist.

Task, The.—A poem by William Cowper. "*The Task*," says Southey, "was at once descriptive, moral, and and satirical. The descriptive parts everywhere bore evidence of a thoughtful mind and a gentle spirit, as well as of an observant eye; and the moral sentiment which pervaded them gave a charm in which descriptive poetry is often found wanting. The best didactic poems, when compared with *The Task*, are like formal gardens in comparison with woodland scenery." "*The Task*," says Hazlitt, "has fewer blemishes than *The Seasons;* but it has not the same capital excellence, the 'unsought grace' of poetry, the power of moving and infusing the warmth of the author's mind into that of the reader."

Teazle (*tē'zl*), **Lady.**—The heroine of Sheridan's comedy *The School for Scandal*, and the wife of Sir Peter Teazle, an old gentleman who marries late in life. She is represented as being "a lively and innocent, though imprudent, country girl, transplanted into the midst of all that can bewilder and endanger her, but with enough of purity about her to keep the blight of the world from settling upon her."

Teazle, Sir Peter.—A character in Sheridan's play *The School for Scandal*, husband of Lady Teazle.

Télémaque (*tā-lā-mäk'*), **Les Aventures de:** "*Adventures of Telemachus*".—A romance by Fenelon, published in 1699. It is founded on the legendary history of Telemachus, and is one of the classics of French literature. Though the beautiful fiction of *Telemachus*, which has much in common with, and was doubtless suggested to Fenelon by the *Argenis*, be rather an epic poem in prose than a romance, it seems to have led the way to several political romances, or, at least, to have nourished a state for this species of composition.

Teli, William.—Title of a drama by Schiller. The hero is chief of the confederates of the forest cantons of Switzerland, and son-in-law of Walter Fürst. Having refused to salute the Austrian cap which Gessler, the Austrian governor, had set up in the market-place of Altorf, he was condemned to shoot an apple from the head of his own son. He succeeded in this perilous task, but, letting fall a concealed arrow, was asked by Gessler with what object he had secreted it. "To kill thee, tyrant," he replied, "if I had failed." The governor now ordered him to be carried in chains across the Lake Lucerne to Küssnacht Castle, "there to be devoured alive by reptiles"; but, a violent storm having arisen on the lake, he was unchained, that he might take the helm. Gessler was on board; and, when the vessel neared the castle, Tell leaped ashore, gave the boat a push into the lake, and shot the governor. After this he liberated his country from the Austrian yoke.

Tempest, The.—One of Shakespeare's fairy plays. The story runs: Prospero, duke of Milan, was dethroned by his brother Antonio, and left on the open sea with his three-year-old daughter Miranda, in "a rotten carcass of a boat." In this they were carried to an enchanted island, uninhabited except by a hideous creature, Caliban, the son of a witch. Prospero was a powerful enchanter, and soon had not only Caliban, but all the spirits of the region under his control, including Ariel, chief of the spirits of the air. Years afterward Antonio, Alfonso, Sebastian and other friends of the usurper came near the island. Prospero, by his magic, raises a storm which casts their ship on the shore and the whole party are spellbound and brought to Prospero. Plots and counterplots follow, bringing in Caliban and clowns; but all are made ridiculous and are defeated by Prospero and Ariel.

Tessa (*tes'ä*).—In George Eliot's novel of *Romola* is the peasant girl who is deceived into marriage with Tito Melema.

Thangbrand.—*Tales of a Wayside Inn*, Henry W. Longfellow. King Olaf's drunken priest, "short of stature, large of limb," who was sent to Iceland, found the people poring over their books, and sailed backed to Norway to say to Olaf "little hope is there of these Iceland men."

Theagenes (*thē-aj'e-nēz*) **and Chariclea** (*kar-i-klē'ä*).—The chief characters in a Greek love story, by Heliodorus, bishop of Trikka, fourth century. A charming fiction, largely borrowed from by subsequent novelists, and especially by Mdlle. de Scudéri, Tasso, Guarini, and D'Urfé.

Thekla.—The daughter of Wallenstein in Schiller's drama of this name. She is an invention of the poet.

Theodorus.—The name of a physician, in Rabelais' romance of *Gargantua*. At the request of Ponocrates, Gargantua's tutor, he undertook to cure the latter of his vicious manner of living, and accordingly "purged him canonically with Anticyrian hellebore," by which medicine he cleared out all the perverse habits of his brain, so that he became a man of honor, sense, courage, and piety.

Theresa, or **Teresa** (*te-rē'sä*, or *tā-rā'sä*).—Daughter of the count palatine of Padolia, beloved by Mazeppa, in Byron's *Mazeppa*.

Thersites (*ther-sī'tēz*).—A scurrilous Grecian chief, loquacious, loud and coarse, in the *Iliad*. His chief delight was to inveigh against the kings of Greece. He squinted, halted, and on his tapering head grew a few white patches of starveling down.

Thopas, Sir.—In the *Canterbury Tales*, a capital sportsman, archer, wrestler, and runner, who resolved to marry no one but an "elf queen," and accordingly started for Faëryland. Story left unfinished.

Thorberg Skafting.—*Tales of a Wayside Inn*, Henry W. Longfellow. The master-builder ordered by King Olaf to build a ship twice as long and twice as large as the *Dragon*, built by Raud the Strong, which was stranded.

Three Musketeers [*Trois Mousquetaires* (*trwä mōs-ke-tar'*), *Les*].—A novel by Alexander Dumas *père*, published in 1844. The scene is laid in the time of Richelieu. The three musketeers are Athos, Porthos, and Aramis, but D'Artagnan is the principal character. He is a young Gascon of an adventurous yet practical nature, with a genius for intrigue, who goes up to Paris to seek his fortune with an old horse, a box of miraculous salve given to him by his mother, and his father's counsels. His career is one of hairbreadth escapes (with death, in the end, on the field of battle) in the society of the three musketeers.

Thyestean Banquet.—Referred to in Milton's *Paradise Lost*. A cannibal feast. Thyestes was given his own two sons to eat at a banquet served up to him by his brother Atreus.

Thyrsis (*ther'sis*).—A herdsman introduced inthe *Idylls* of Theocritos, and in Vergil's *Eclogues*.

> Hard by, a cottage chimney smokes
> From betwixt two aged oaks,
> Where Corydon and Thyrsis, met,
> Are at their savory dinner set.
> Milton, *L'Allegro*.

Timias.—King Arthur's squire in Spenser's *Faërie Queene*. He went after the "wicked foster," from whom Florimel fled, and the "foster" with his two brothers, falling on him, were all slain.

Tobey, Uncle.—A character in Sterne's *Tristram Shandy*. A captain who was wounded at the siege of Namur, and was obliged to retire from the service. He is the impersonation of kindness, benevolence, and simple-heartedness; his courage is undoubted, and his gallantry delightful for its innocence and modesty.

Tommy Atkins.—*Barrack-Room Ballads*, Kipling. The name is here used in its general meaning, a British soldier. The name came from the little pocket ledgers served out, at one time, to all British soldiers. In these manuals were to be entered the name, the age, the date of enlistment, etc. The war office sent with each little book a form for filling it in, and the hypothetical name selected was *Tommy Atkins*. The books were instantly so called, and it did not require many days to transfer the name from the book to the soldier.

Tom Sawyer, Adventures of.—By Mark Twain. An "elastic" youth whose performances delight both old and young readers. Queer enterprises, influenced by the old superstitions among slaves and children in the Western states give reliable pictures of boy-life in the middle of the nineteenth century.

Topsy.— *Uncle Tom's Cabin*, Mrs. Stowe. A young slave-girl, who never knew whether she had either father or mother, and being asked by Miss Ophelia St. Clare how she supposed she came into the world, replied, "I 'spects I growed."

Touchstone (*tuch'stōn*).—A clown in Shakespeare's *As You Like It*. His seven degrees of the lie are: (1) The retort courteous, (2) the quip modest, (3) the reply churlish, (4) the reproof valiant, (5) the countercheck quarrelsome, (6) the lie circumstantial, (7) the lie direct.

Townley Mysteries.—Certain religious dramas; so called because the MS. containing them belonged to P. Townley. These dramas are supposed to have been acted at Widkirk abbey, in Yorkshire.

Tranio (*trā'ni-ō*).—In Shakespeare's *Taming of the Shrew*, one of the servants of Lucentio, the gentleman who marries Bianca, sister of Katharina "the Paduan shrew."

Triads.—Three subjects, more or less connected, formed into one continuous poem or subject; thus the "Creation, Redemption, and Resurrection" would form a triad.

Trim, Corporal.—Uncle Toby's attendant, in Sterne's novel, *The Life and Opinions of Tristram Shandy, Gent*, distinguished for his fidelity and affection, his respectfulness, and his volubility.

Tristram (*tris'tram*), **Sir.**—One of the most celebrated heroes of mediæval romance. His adventures form an episode in the history of Arthur's court, and are related by Thomas the Rhymer, as well as by many romancists.

Tubal (*tū'bal*).—A wealthy Jew, the friend of Shylock, in Shakespeare's *The Merchant of Venice*.

Tuck, Friar.—*Ivanhoe*, Scott. The father-confessor of Robin Hood and connected with Fountain's Abbey. He is represented as a clerical Falstaff, very fat and self-indulgent, very humorous, and somewhat coarse. His dress was a russet habit of the Franciscan order. He was sometimes girt with a rope of rushes. Friar Tuck also appears in the "morris dance" on Mayday.

Turveydrop.—*Bleak House*, Dickens. A conceited dancing-master, who imposes on the world by his majestic appearance and elaborate toilette. He is represented as living upon the earnings of his son, who has a most slavish reverence for him as a perfect "master of deportment."

Tutivillus (*tū-ti-vil'us*).—In Langland's *Visions of Piers Plowman*, the demon who collects all the fragments of words omitted, mutilated, or mispronounced by priests in the performance of religious services, and stores them up in that "bottomless" pit which is "paved with good intentions."

Tweedledum and Tweedledee.—The prince of Wales was the leader of the Handel party, supported by Pope and Dr. Arbuthnot; and the duke of Marlborough led the Bononcinists, and was supported by most of the nobility.

Twelfth Night.—A drama by Shakespeare. The story is said to have come from a novelette written early in the sixteenth century. A brother and sister, twins, are shipwrecked. Viola, dressed like her brother, becomes page to the duke Orsino. The duke was in love with Olivia, and, as the lady looked coldly on his suit, he sent Viola to advance it; but the willful Olivia, instead of melting toward the duke, fell in love with his beautiful page. Sebastian, the twin-brother of Viola, was attacked in a street brawl before Olivia, and, thinking him to be the page, she invited him in. The result was the marriage of Sebastian to Olivia, and of the duke to Viola.

Twice-Told Tales.—A collection of tales by Nathaniel Hawthorne, some of which had been already published in the *Token*, and other periodicals. They are mystical and, though in prose form, are the work of a poet. The tales are nearly all American in subject, but are treated from the spiritual rather than the practical side.

Two Gentlemen of Verona (*vā-rō'nä*).—A drama by Shakespeare, the story of which is taken from the *Diana* of Montemayor (sixteenth century). The plot resembles that of *Twelfth Night*, as Julia, disguised as a page, is a prominent figure.

U

Uarda (*ō-är'dä*).—A novel by Ebers, published in 1877. The scene is laid chiefly in Egypt at the time of the reign of Rameses II.

Ubaldo.—*Jerusalem Delivered*, Tasso. One of the older crusaders, who had visited many regions. He and Charles the Dane went to bring back Rinaldo from the enchanted castle.

Ubeda.—*Don Quixote*, Cervantes. A noted artist who one day painted a picture, but was obliged to write under it, "This is a cock," in order that the spectator might know what was intended to be represented.

Thule (*thū'lē*).—"*Ultima Thule*." The extremity of the world; the most northern point known to the ancient Romans. Pliny and others say it is Iceland.

Una (*ū'nä*).—*Faërie Queene*, Spenser. The personification of truth. She goes, leading a lamb and riding on a white ass, to the court of Gloriana, to crave that one of her knights might undertake to slay the dragon which kept her father and mother prisoners. The adventure is accorded to the Red Cross Knight. Being driven by a storm into Wandering Wood, a vision is sent to the knight which causes him to leave Una, and she goes in search of him. In her wanderings a lion becomes her attendant. After many adventures, she finds St. George, "the Red Cross Knight," but he is severely wounded. Una takes him to the House of Holiness, where he is carefully nursed, and then leads him to Eden.

Uncle Tom's Cabin.—A work of fiction by Mrs. Harriet Beecher Stowe. It had an enormous sale, and at once made the author famous. As a picture of slave life as it once obtained in the Southern states of America it is certainly unsurpassed. The scenes described in it are so terrible that Mrs. Stowe deemed it advisable to publish in 1853 a *Key* to the work, showing the large extent to which it is founded upon fact. The hero is, of course, Uncle Tom.

Uncle Tom was an old negro slave of unaffected piety, and most faithful in the discharge of all his duties. His master, a humane man, becomes em-

barrassed in his affairs, and sells him to a slave-dealer. After passing through various hands, and suffering intolerable cruelties, he dies. The figure next in interest is Legree, the brutal slave-owner. Everyone, also, will remember Eva and Topsy.

Urganda (*ŏr-gän'dă*).—In the romance of *Amadis de Gaul*, a powerful fairy sometimes appearing in all the terrors of an evil enchantress.

Uriel (*ū'ri-el*), or **Israfil.**—In the *Koran*, the angel who is to sound the resurrection trumpet. Longfellow, in *The Golden Legend*, calls him "the minister of Mars," and says that he inspires man with "fortitude to bear the brunt and suffering of life."

Uther (*ū'ther*).—Son of Constans, one of the fabulous or legendary kings of Britain, and the father of Arthur.

Utopia (*ū-tō'pi-ă*).—The name of an imaginary island described in the celebrated work of Sir Thomas More, in which was found the utmost perfection in laws, politics, and social arrangements. More's romance obtained a wide popularity, and the epithet *Utopian* has since been applied to schemes for the improvement of society which are deemed not practicable.

Uzziel.—In *Paridise Lost*, the next in command to Gabriel. The word means "God's strength."

V

Valentine (*val'en-tīn*).—(1) One of the heroes in the old romance of *Valentine and Orson*. (2) One of the *Two Gentlemen of Verona*, by Shakespeare. (3) A gentleman attending on the duke in Shakespeare's *Twelfth Night*. (4) One of the characters in Goethe's *Faust*. He is a brother of Margaret.

Valerian (*va-lē'ri-an*).—*Canterbury Tales*, Chaucer. The husband of St. Cecilia. Cecilia told him she was beloved by an angel, who constantly visited her; and Valerian requested to see this visitant. Cecilia replied that he could do so if he went to Pope Urban to be baptized. This he did, and on returning home the angel gave him a crown of lilies, and to Cecilia a crown of roses, both from the garden of paradise.

Valley of Humiliation.—*Pilgrim's Progress*, Bunyan. The place where Christian encountered Apollyon, just before he came to the "Valley of the Shadow of Death."

Vanity Fair.—A novel without a hero, by Thackeray. "There are scenes of all sorts," says the author in his preface to the work, "some dreadful combats, some grand and lofty horse-riding, some scenes of high life and some of very middling indeed, some love making for the sentimental, and some light comic business; the whole accompanied by appropriate scenery, and brilliantly illuminated by the author's own candle."

Vathek (*vath'ek*).—By Beckford. Originally written in French. "It was composed," says the author, "at twenty-two years of age. It took me three days and two nights of hard labor. I never took off my clothes the whole time." The description of the Hall of Eblis, which is often quoted, was taken, it appears, from the old hall at Fonthill, Beckford's residence, probably the largest in any private house in England. "It was from that hall I worked, magnifying and coloring it with Eastern character. All the female characters were portraits drawn from the domestic establishment of old Fonthill, their good or evil qualities ideally exaggerated to suit my purpose." *Vathek* was translated into English, it is not known by whom, immediately on its appearance. "It was one of the tales," says Byron, "I had a very early admiration of. For correctness of costume, beauty of description, and power of imagination, it far surpasses all European imitations, and bears such marks of originality that those who have visited the East will find some difficulty in believing it to be more than a translation."

Veck, Toby.—*The Chimes*, Dickens. A ticket-porter who went on errands and bore the nickname Trotty. One New Year's eve he had a nightmare and fancied he had mounted to the steeple of a neighboring church, and that goblins issued out of the bells. He was roused from his sleep by the sound of the bells ringing in the new year.

Veiled Prophet.—*Lalla Rookh*, Moore. He assumed to be a god, and maintained that he had been Adam, Noah, and other representative men. Having lost an eye, and being otherwise disfigured in battle, he wore a veil to conceal his face, but his followers said it was done to screen his dazzling brightness.

Vernon, Di, or **Diana.**—*Rob Roy*, Scott. The heroine of the story, a high-born girl of great beauty and talents. She is an enthusiastic adherent to a persecuted religion and an exiled king.

Vicar of Wakefield.—A novel by Goldsmith. The hero is Dr. Primrose, a simple-minded, pious clergyman, with six children. He begins life with a good fortune, a handsome house, and wealthy friends, but is reduced to poverty without any fault of his own, and, being reduced like Job, like Job he is restored.

Vincentio (*vin-sen'shiō*).—The duke of Vienna in Shakespeare's *Measure for Measure*. He commits his scepter to Angelo, under the pretext of being called to take an urgent and distant journey, and by exchanging the royal purple for a monk's hood, observes incognito the condition of his people.

Vincy (*vin'si*), **Rosamond.**—One of the principal female characters in George Eliot's novel *Middlemarch*.

Viola. (*vī'ō-lă*) —*Twelfth Night*, Shakespeare. A sister of Sebastian. They were twins, and so much alike that they could be distinguished only by their dress. When they were shipwrecked Viola was brought to shore by the captain, but her brother was left to shift for himself. Being in a strange land, Viola dressed as a page, and, under the name of Cesario, entered the service of Orsino, duke of Illyria. The duke greatly liked his beautiful page, and, when he discovered her true sex, married her.

Violenta.—*All's Well That Ends Well*, Shakespeare. A character in the play who enters upon the scene only once, and then she neither speaks nor is spoken to. The name has been used to designate any young lady nonentity; one who contributes nothing to the amusement or conversation of a party.

Virgilia (*ver-jil'i-ă*).—In Shakespeare's *Coriolanus*, was the wife of Coriolanus, and Volumnia his mother; but historically Volumnia was his wife and Veturia his mother.

Virginia (*ver-jin'i-ă*).—A young Roman plebeian of great beauty, decoyed by Appius Claudius, one of the decemvirs, and claimed as his slave. Her father, Virginius, being told of it, hastened to the forum, and arrived at the moment when Virginia was about to be delivered up to Appius. He seized a butcher's knife, stabbed his daughter to the heart, rushed from the forum, and raised a revolt. This has been the subject of a host of tragedies. It is one of Lord Macauley's lays (1842), supposed to be sung in the forum on the day when Sextus and Licinus were elected tribunes for the fifth time.

Vivian (*viv'i-an*), or **Viviane,** or **Vivien.**—In the Arthurian cycle of romance, an enchantress, the mistress of Merlin. She brought up Lancelot in her palace, which was situated in the midst of a magical lake; hence her name "the Lady of the Lake."

Volpone (*vol-pō'ne*), or the *Fox.*—A comedy by Ben Jonson, written in 1605. Hazlitt calls it his best play; prolix and improbable, but intense and powerful. It seems formed on the model of Plautus in unity of plot and interest. The principal character is represented as a wealthy sensualist, who tests the character of his friends and kinsmen by a variety of strategems, obtains from them a large addition to his riches by the success of his impostures, and finally falls under the vengeance of the law. "*Volpone*," says Campbell, "is not, like the common misers of comedy, a mere money-loving dotard, a hard, shriveled old mummy, with no other spice than his avarice to preserve him—he is a happy villain, a jolly misanthrope, a little god in his own selfishness; and Mosca is his priest and prophet. Vigorous and healthy, though past the prime of life, he hugs himself in his harsh humor, his successful knavery and imposture, his sensuality and his wealth, with an unhallowed relish of selfish existence."

W

Wallenstein (*väl'len-stīn*).—A trilogy by Schiller, comprising *Wallenstein's Lager*, *Die Piccolomini*, and *Wallenstein's Tod*. Schiller conceives his hero in these dramas as the type of the practical realist, serious, solitary, and reserved.

Wandering Jew, The—(F. *Le Juif Errant*).—A novel by Eugene Sue. The chief character is an imaginary person in a legend connected with the history of Christ's passion. As the Savior was on the way to the place of execution, overcome with the weight of the cross, he wished to rest on a stone before the house of a Jew, who drove him away with curses. Driven by fear and remorse, he has since wandered, according to the command of the Lord, from place to place, and has never yet been able to find a grave.

War and Peace.—An historical novel by Tolstoi, published 1865-1868. The scene is laid in the time of the Czar Alexander I., and the novel is a picture of Russian society during the Russo-French wars.

Waverley (*wā'ver-li*) **Novels.**—General name given to Scott's historical novels.

Wayside Inn, Tales of a.—Poems in various meters by Henry Wadsworth Longfellow. The first series includes a Prelude (*The Wayside Inn*), the Landlord's

Tale (*Paul Revere s Ride*), the Student's Tale (*The Falcon of Ser Federigo*), the Spanish Jew's Tale (*The Legend of Rabbi Ben Levi*), the Sicilian's Tale (*King Robert of Sicily*), the Musician's Tale (*The Saga of King Olaf*), the Theologian's Tale (*Torquemada*), the Poet's Tale (*The Birds of Killingworth*), several Interludes, and Finale.

Weller (*wel'er*), **Sam.**—In Dickens' celebrated *Pickwick Papers*. A servant to Mr. Pickwick, to whom he becomes devotedly attached. Rather than leave his master when he is sent to the Fleet, Sam Weller gets his father to arrest him for debt. He is an inimitable compound of wit, simplicity, quaint humor, and fidelity. Tony Weller, father of Sam; a coachman of the old school, who drives between London and Dorking. On the coachbox he is a king, elsewhere a mere London "cabby." He marries a widow, and his constant advice to his son is, "Sam, beware of the vidders."

Westward Ho!—A novel by Charles Kingsley, the scene of which is laid in "the spacious times of great Elizabeth," when the safety of England was threatened by the Spanish armada. Several historical personages figure in the story, such as Sir Walter Raleigh, Sir Richard Grenville, Admiral Hawkins, and Sir Francis Drake; and the narrative carries the reader from Bideford to London, and from thence to Ireland, to the Spanish main, and the South American continent, back again to Bideford and Plymouth, whence the hero, Amyas Leigh, sails to take part in the famous sea-fight.

Wild (*wild*), **Jonathan.**—A cool, calculating, heartless villain, with the voice of a Stentor, hero of Defoe's romance of the same name.

Wilford.—(1) In Knowles' *The Hunchback*, supposed to be earl of Rochdale. (2) In Knowles' *The Beggar of Bethnal Green*, the truant son of Lord Woodville, who fell in love with Bess, the daughter of the "blind beggar of Bethnal Green."

Wilhelm Meister (*vil'helm mīs'ter*).—Title of a philosophic novel by Goethe. The object is to show that man, despite his errors and shortcomings, is led by a guiding hand, and reaches some higher aim at last. This is considered to be the first true German novel.

Wimble (*wim'bl*), **Will.**—A member of the fictitious *Spectator Club*, said to be intended as a portrait of a Mr. Thomas Morecroft, a gentleman of simple habits and good nature.

Winter's Tale, The.—A play by Shakespeare. Leontês, King of Sicily, invites his friend Polixenês to visit him, becomes jealous, and commands Camillo to poison him. Camillo warns Polixenês, and flees with him to Bohemia. Leontês casts his queen, Hermionê, into prison, where she gives birth to a daughter. Hermionê is reported dead and the child is brought up by a shepherd, who calls it Perdita. Florizel sees Perdita and falls in love with her; but Polixenês, his father, tells her that she and the shepherd shall be put to death if she encourages the suit. Florizel and Perdita flee to Sicily, and being introduced to Leontês, it is soon discovered that Perdita is his lost daughter. Polixenês tracks his son to Sicily, and consents to the union. The party are invited to inspect a statue of Hermionê, and the statue turns out to be the living queen.

Worldly-Wiseman, Mr.—One of the characters in Bunyan's *Pilgrim's Progress*, who converses with Christian by the way, and endeavors to deter him from proceeding on his journey.

Wrayburn (*rā'bern*) **Eugene.**—*Our Mutual Friend*, Dickens. Barrister-at-law; an indolent, moody, whimsical young man, who loves Lizzie Hexam. After he is nearly killed by Bradley Headstone, he reforms and marries Lizzie, who saved his life.

Y

Yahoo (*yā-hō'*).—A name given by Swift, in his satirical romance of *Gulliver's Travels*, to one of a race of brutes having the form and all the vices of man. The Yahoos are represented as being subject to the Houyhnhnms, or horses endowed with reason.

Yorick (*yor'ik*).—(1) The King of Denmark's jester, mentioned in Shakespeare's *Hamlet*. Hamlet picks up his skull in the churchyard and apostrophizes it. (2) A humorous and careless parson in Sterne's *Tristram Shandy*.

Z

Zadig.—The title of a novel by Voltaire. Zadig is a wealthy young Babylonian, and the object of the novel is to show that the events of life are beyond human control.

Zanoni (*za-nō'ni*).—Hero of a novel, so-called, by Lord Lytton. Zanoni is supposed to possess the power of communicating with spirits, prolonging life, and producing gold, silver, and precious stones.

Zara (*zā'rā;* French, *zaire*), a tragedy by Voltaire. Zara is the daughter of Lusignan d Outremer, king of Jerusalem and brother of Nerestan. For twenty years Lusignan and his two children were captives at the court of the sultan Osman. The latter loves Zara, and was jealous of Nerestan, of whose relationship he was ignorant, and stabbed her to the heart. Nerestan being brought before the sultan, told him he had slain his sister. Osman then stabbed himself out of remorse.

Zenobia (*ze-nō'bi-ā*).—*Blithedale Romance*, Hawthorne. A strong-minded woman, beautiful and intelligent, who was interested in playing out the pastoral of the life at Brook Farm. She is represented as disappointed in love, and at last she drowned herself.

Zephon.—A "strong and subtle spirit" in Milton's *Paradise Lost*, whom Gabriel dispatched with Ithuriel to find Satan.

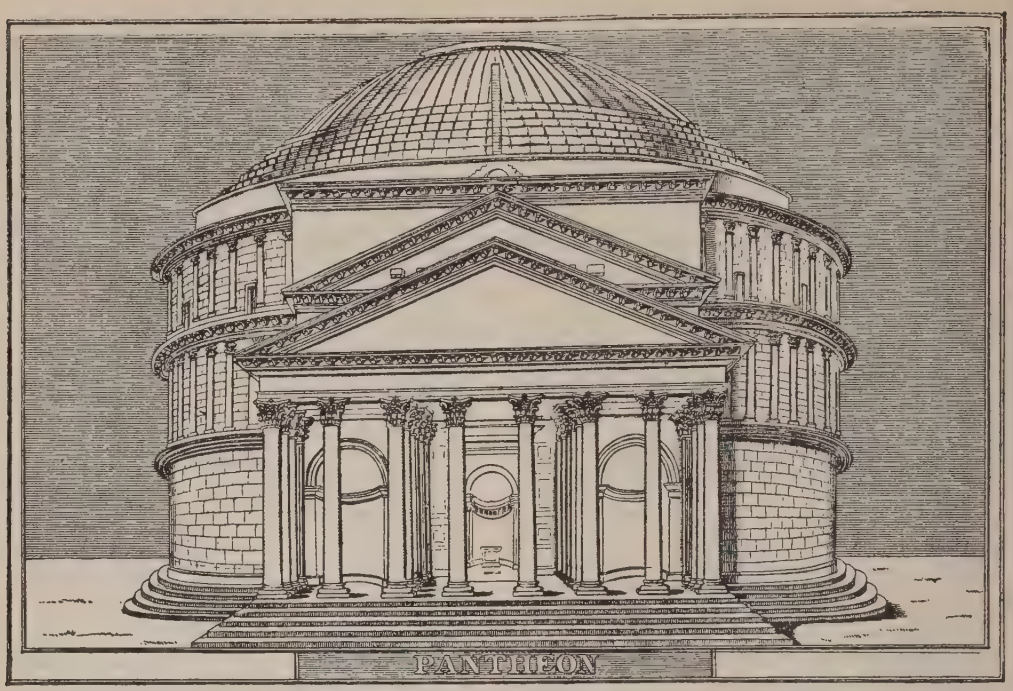
Zillah.—One of Southey's characters, beloved by Hamuel, a brutish sot. Zillah rejected his suit, and Hamuel vowed vengeance. Accordingly, he gave out that Zillah had intercourse with the devil, and she was condemned to be burnt alive. God averted the flames, which consumed Hamuel; but Zillah stood unharmed, and the stake to which she was bound threw forth white roses, "the first ever seen on earth since paradise was lost."

Zimri (*zim'ri*).—In Dryden's *Absalom and Achitophel*, is intended for George Villiers, duke of Buckingham, who had satirized Dryden in *The Rehearsal* as Bayes.

Zophiel (*zō'fi-el*).—In Milton's *Paradise Lost*, an angelic scout.

Zuleika (*zū-lē'kā*).—The heroine in Byron's poem of *The Bride of Abydos*, in love with Selim:

> "Fair, as the first that fell of womankind . . .
> Soft, as the memory of buried love;
> Pure, as the prayer which childhood wafts above:
> Such was Zuleika—such around her shone
> The nameless charms unmark'd by her alone:
> The light of love, the purity of grace,
> The mind, the music breathing from her face,
> The heart whose softness harmonized the whole—
> And, oh! that eye was in itself a soul!"



This beautiful Roman temple, said to have been erected by Agrippa in 27 B. C., was dedicated to all the gods of Greece and Rome. It is lighted by a single aperture in the center of its magnificent dome. (See illustration on next page.)

GODS, HEROES AND MYTHICAL WONDER TALES

A myth is a story told about gods or heroes. Mythology is a term applied to the collected myths of a nation or people, sometimes to the scientific study of myths. The first to busy itself in a large sense with mythology was the Greeks, whose myths had the most luxuriant and fanciful development. When the Romans received the arts and sciences from the Greeks, they adopted also their gods and their entire religious system. Thus it was that the Greek and Roman mythologies were to a great extent the same.

THE IMPORTANCE OF MYTHOLOGY IN EDUCATION

On account of their great beauty and universal interest, myths were made the themes of poets, priests, artists and commentators alike. Not only were the myths the inspiration of classical literature, art and religion, but they kept their place in later civilizations, and mythological allusions are so frequent in our own literature that an acquaintance with classic fable is a necessary part of modern education.

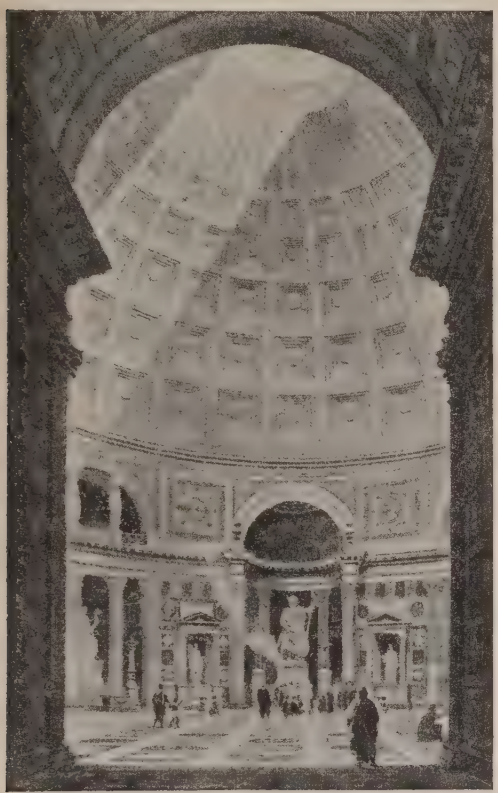
HOW THE MYTHS ORIGINATED

A large proportion of these myths are due to men's observations of Nature, and her various active and creative forces, which appeared to their lively Southern fancy as manifestations of single supernatural beings. These were regarded now as friendly, now as hostile, to man; and men therefore strove as eagerly to gain their favor as to appease their wrath. Of the appearance of the deities who thus manifested themselves in the workings of nature, men necessarily formed at first very crude and fantastic ideas. But later, when men emerged from the simple conditions of the early patriarchal epoch, and began to dwell in regular political communities, they gradually ceased to regard the gods as mere personifications of natural forces. They began to regard them as beings acting in accordance with unchangeable moral laws, and endowed with forms similar to those of men. They brought the gods into connection with each other by means of genealogies in a great measure artificial, and built up a vast political system, which has its center in Zeus, or Jupiter, the "father of gods and men." (See Chart on following pages.)

HOW THE GODS RESEMBLE MORTALS

The ancient Greeks believed their gods to be of the same shape and form as themselves, but of far greater beauty, strength, and dignity. They also regarded them as being of much larger size than men; for in those times great size was esteemed a perfection, supposed to be an attribute of divinities, to whom they ascribed all perfections. A fluid named ichor supplied the place of blood in the veins of the gods. They were immortal, but they might be wounded or otherwise injured. They could make them-

selves visible or invisible to men, and assume the forms of men or of animals. Like men they stood in daily need of food and sleep. The meat of the gods was called ambrosia, their drink nectar. The gods, when they came among men, often partook of their food and hospitality.



Glimpse into the interior of the Pantheon at Rome showing statues of the gods and the marvelous effects of lighting.

Like mankind, the gods were divided into two sexes; namely, gods and goddesses. They married and had children. Often a god became enamored of a mortal woman, or a goddess was smitten with the charms of a handsome youth, and these love tales form a large portion of Grecian mythology.

To make the resemblance between gods and men more complete, the Greeks ascribed to their deities all human passions, both good and evil. They were capable of love, friendship, gratitude, and all affections; on the other hand, they were frequently envious, jealous, and revengeful. They were particularly careful to exact all due respect and attention from mankind, whom they required to honor them with temples, prayers, costly sacrifices, splendid processions, and rich gifts; and they severely punished insult or neglect.

HOW AND WHERE THE GODS LIVED

If we look to the employment of the gods, we find that it consists chiefly in pleasant idleness; though they endeavor, like the rich among mankind, to make time fly by indulging in their favorite pastimes. They take their meals in common, and assemble for this purpose in the palace of Zeus, on the windy heights of Olympus. There they refresh themselves, while Hebe ministers to their wants, listening to the strains of Apollo's lute, and to the songs of the sweet-voiced Muses, and entertaining themselves with pleasant conversation. Not always, indeed, is the company so peaceful and pleasant. At times these great gods quarrel finely; nay, even small conspiracies arise to interrupt the uniformity of their existence, such as that of Hera, Poseidon, and Athene against Zeus during the Trojan war, which is related in the fifteenth book of the "Iliad."

RELATIONSHIP AND DOMINION OF THE GODS

Lastly, that no point in their resemblance to mankind may be omitted, all the different deities are united in one great family, of which Zeus, or Jupiter, the father of men and the ruler of the gods, is the head and center. Zeus has, however, a special dominion over the celestial deities only, those of the sea and waters being subjected to Neptune or Poseidon, and those of the lower world to Hades, or Pluto.

A PRONOUNCING DICTIONARY OF MYTHOLOGY

KEY TO PRONUNCIATION

The long (marked) vowels are pronounced as in the following words; *fāte, fâre, far; mē; mīne; mōte; mūte.* The short vowels, which include all not marked as above, are pronounced as in the following words: *pat; pet; pit; pot; put.* The accented syllable in each word is indicated by a mark placed immediately after it (*q.v.*), *quod vide* (L) —which see.

Abaris (*ab'a-ris*).—A mythical personage who is said to have taken no earthly food, and to have ridden on an arrow—the gift of Apollo, whose priest he was—through the air.

Absyrtus (*ab-sir'tus*).—A son of Æetes, king of Colchis, sister of Medea. (See "Medea.")

Acamas (*ak'a-mās*).—(*i*) Son of Theseus and Phædra; went with Diomedes to Troy to recover Helen.

Acantha (*ak-an'tha*).—A nymph beloved by Apollo and changed into the acanthus.

Acca Laurentia (*ak'ka law-ren'shi-a*).—The nurse of Romulus and Remus, after they had been taken from the she-wolf. (See "Romulus.")

Achates (*a-kā'tēz*).—A friend of Æneas—"*fidus Achates*" famous for his fidelity.

Acheloïades (*a-ke-lō'i-a-dēz*).—The Sirens, so called because they were the daughters of Achelous.

Achelous (*ak-el'ō-us*).—The river-god was the son of Oceanus and Tethys, and the eldest of three thousand brothers. He and Hercules both loved Deianira, and fought for the possession of her. Hercules conquered him, when he took the form of a bull, but was defeated again and deprived by Hercules of one of his horns. Achelous, who was looked upon as the representative of all fresh water, was considered a great divinity throughout Greece.

Acheron (*ak'er-ōn*).—Generally signifies the whole of the lower world. Properly, it is the river of the lower world, around which the shades of the departed hover, and into which the Cocytus and Pyriphlegethon flow. There are other rivers also named Acheron.

Achilles (*a-kill'ēz*).—The great hero of the *Iliad.* He was the son of Peleus, king of the Myrmidones, and the Nereid Thetis. His mother, wishing to make him immortal, plunged him, when an infant, into the river Styx, and succeeded with the exception of the ankles, by which she held him. He was educated by Phoenix and Chiron, the centaur—the former teaching him

eloquence and the arts of war, the latter the healing art. When he was but nine years old, Calchas declared that Troy could not be taken without his aid. His mother, knowing that this war would be fatal to him, disguised him as a girl and sent him to dwell with the daughters of Lycomedes, at whose court he was called Pyrrha (*pir'ra*), *i.e.*, red or tawny, on account of his auburn hair. Seeing, however, that Troy could not be taken without his aid, the crafty Ulysses, disguished as a merchant, sought him out, offering for sale jewels and articles of feminine attire, among which he had placed some arms. The ruse succeeded, as Achilles, by eagerly seizing the arms, at once betrayed his sex, and accompanied Ulysses to the Greek army before Troy. While at Lycomedes' court he became by Deidamia the father of Pyrrhus, or Neoptolemus. Before Troy he performed great feats of valor. After killing numbers of Trojans, he at length met Hector, whom he chased thrice round the walls of the city, and, having slain him, tied his body to his chariot and dragged it to the ships of the Greeks. He had an invulnerable suit of armor made, at his mother's request, by Vulcan. Finally, he was slain by Paris, son of Priam, who shot him in the heel, his only vulnerable part. He is the principal hero of the *Iliad*, and is represented as the handsomest and bravest of all the Greeks. After his death Achilles became one of the judges in the lower world, and dwelt in the islands of the blessed, where he was united to Medea, or Iphigenia.

Acis (*ā'sis*).—A Sicilian shepherd, beloved by the nymph Galatea. He was crushed, through jealousy, under a huge rock by Polyphemus, the Cyclop, and his blood gushing forth from under was changed by the nymph into the river Acis, at the foot of Mount Etna.

Actæon (*ak-tē'ōn*).—A mighty huntsman, son of Aristæus and Autonoë. One day while hunting he saw Diana and her nymphs bathing, and was immediately changed by the goddess into a stag, in which form he was torn to pieces by his fifty dogs.

Admetus (*ad-mē'tus*).—King of Pheræ, in Thessaly. On the death of his first wife he sued for the hand of Alcestis, whom he obtained, by Apollo's aid, only on coming in a chariot drawn by a lion and a wild boar. The god (Apollo) tended the flocks of Admetus for nine years, when he was compelled to serve a mortal for having slain the Cyclops. Apollo prevailed on the Fates to grant that Admetus should never die if another would lay down his life for him. This Alcestis did, but was brought back from the lower world by Hercules.

Adonis (*a-dō'nis*).—A beautiful youth beloved by Venus. While hunting he was killed by a wild boar, and was changed by Venus into the anemone. The grief of Venus was so great that the gods of the nether regions allowed him to spend six months of every year with Venus upon the earth. (This myth seems to refer to the apparent death of nature in winter and its revival in spring; hence Adonis spends six months in the lower and a like period in the upper world.)

Æacus (*ē'ak-us*).—Son of Jupiter and Ægina. It is related that at his birth in the island of Ægina, which was named after his mother, there were no inhabitants on the island, and that Jupiter changed the ants there into men; hence the latter were called Myrmidones (Gr. ants), and Æacus ruled over them. Æacus was renowned throughout Greece for his justice and piety, and after his death became one of the three judges in Hades (the other two being Rhadamanthus and Minos).

Aedon (*a-ē'dŏn*).—Daughter of Pandareus and wife of Zethus, king of Thebes. Jealous of Niobe, her brother Amphion's wife, having six sons and six daughters, while she had but one son, she determined to kill the eldest of Niobe's sons, but by mistake slew her own son Itylus. Jupiter changed her into a nightingale, whose melancholy notes are represented as Ædon's lamentations for her son.

Æetes (*ē-ē'tēz*) or **Æeta** (*ē-ē'ta*).—Son of Helios (the sun) and Persëis, and king of Colchis at the time Phrixus had fled to his court on a ram with golden fleece, the gift of Mercury. (See "Phrixus.") After having sacrificed to Jupiter the ram that had carried him, Phrixus gave its golden fleece to Æetes, who suspended it to an oak tree in the grove of Mars, where it was guarded day and night by an ever-watchful dragon. It was, however, greatly coveted, and an expedition was fitted out, consisting of all the great heroes of the age, with the special object, which proved successful, of obtaining it. (See "Argonautæ.")

Ægæon (*ē-jē'ŏn*).—Son of Uranus (heaven) and Gæa (earth). Ægæon and his brothers, Gyas and Cottus, were huge monsters with a hundred arms and fifty heads. Ægæon and his brothers, who are often called the Uranids, conquered the Titans when they made war upon the gods, and secured the victory to Jupiter, who thrust the Titans into Tartarus, and placed Ægæon and his brothers to guard them. Ægæon is often referred to under the name Briareus.

Æneas (*ē-nē'as*), the hero of Virgil's great epic poem the *Æneid* (*ē-ne'id*), was the son of Anchises and Venus, and was born on Mount Ida. Having been attacked on Mount Ida by Achilles, who also drove away his flocks, he led the Dardanians against the Greeks, and at once took part in the Trojan war. Æneas and Hector were the great Trojan heroes, and the former, being beloved by gods and men, was on more than one occasion saved in battle by the gods. Venus saved him from Diomedes, and Neptune from Achilles, when the latter was on the point of killing him. From the flames of Troy he carried on his back his father, Anchises, and the household gods, and led Ascanius, his son, leaving his wife, Creusa, daughter of Priam, to follow. Æneas then set out on those wanderings that form the subject of the *Æneid*. After visiting Epirus and Sicily he was driven by a storm on the coast of Africa, where he met with Dido, queen of Carthage, who hospitably entertained him and became enamored of him. Æneas, however, left suddenly, and Dido (*q.v.*) killed herself. He then sailed to Latium, where he married Lavinia, the daughter of King Latinus, and founded the town of Lavinium, so named in honor of his wife. Turnus, to whom Lavinia had been betrothed, made war against Latinus and Æneas, but was slain by the latter, who now became ruler of the Aborigines and Trojans. Soon afterwards, however, he was slain in battle by the Rutulians.

Æolus (*ē'o-lus*).—The happy ruler of the Æolian Islands. He had been given, by Jupiter, dominion over the winds, which he kept enclosed in a mountain. When Ulysses was on his journey from Troy to Ithaca, Æolus gave him all the adverse winds in bags, but his companions, from curiosity, opened them.

Æsculapius (*ēs-kū-lā'pi-us*).—The god of healing. He was the son of Apollo and Coronis, and was brought up by Chiron, the centaur, who instructed him in the art of healing and in hunting. When he was grown up, he not only healed the sick, but recalled the dead to life. He was killed by a thunderbolt by Jupiter, who feared lest men should, by his aid, escape death altogether. Serpents were sacred to him, and the cock was sacrificed to him.

Agamemnon (*ag-a-mem'nŏn*).—King of Mycenæ, and brother of Menelaus. He married Clytemnestra, who bore him Iphigenia, Chrysothemis, Laodice (Electra) and Orestes. He was the most powerful prince in Greece. When Helen (*q.v.*) was carried off by Paris, and the Greek chiefs sought to regain her, Agamemnon was chosen commander-in-chief of the expedition. He is not, however, the hero of the *Iliad*, as he is the inferior of Achilles in true nobility of character. At the capture of Troy he received Cassandra, the daughter of Priam, as his prize. On his return home he was murdered by Ægisthus, who, during his absence at Troy, had been living with Agamemnon's wife Clytemnestra. His son Orestes avenged his father's death by slaying both Ægisthus and Clytemnestra.

Aganippe (*ag-a-nip'pē*).—A fountain at the foot of Mount Helicon, in Bœotia, sacred to the Muses, who were hence called Aganippides (*ag-a-nip'pi-dēz*).

Ajax (*ā'jaks*).—There are two heroes having this name, Ajax the Great, or Ajax Telamonius, and The Lesser Ajax, or Ajax Oïleus. (i) Ajax the Great was son of Telamon, king of Salamis, and grandson of Æacus. He took a very prominent part in the Trojan war, and was placed second to Achilles alone in bravery. He was conquered by Ulysses in struggle for the armor of Achilles, and this, according to Homer, was the cause of his death. (ii) The Lesser Ajax, or Ajax, son of Oïleus, also took part in the Trojan war. He was, next to Achilles, the most swift-footed among the Greeks.

Alcathous (*al-kath'o-us*).—Son of Pelops and Hippodamia. Obtained his wife by slaying the Cithæronian lion, which had killed the king's son, and succeeded his father-in-law as king of Megara, the walls of which he restored.

Alcestis or **Alceste** (*al-ses'tē*).—Wife of Admetus (*q.v.*).

Alcmene (*alk-mē'nē*).—Wife of Amphitryon. Jupiter, who appeared disguised as her husband, became by her the father of Hercules.

Alcyone (*al'sī-on-ē*) or **Halcyone.**—Daughter of Æolus and wife of Ceyx. Her husband having perished in a shipwreck, Alcyone's grief became so intense that she threw herself into the sea. Out of compassion the gods changed the two into birds, and while these birds (halcyons) were breeding the sea always remained calm.

Alecto (*a-lek'tō*).—One of the Furies (*q.v.*).

Aloeus (*al-lō'-ūs*).—Son of Neptune and Canace. His wife had, by Neptune, two sons, Otus and Ephialtes, the Aloidæ (*a-lō'i-dē*), who were of extraordinary size

and strength. At the age of nine years they attempted to scale heaven by piling Mount Ossa upon Olympus and Pelion upon Ossa. To prevent them accomplishing this when they grew older Apollo destroyed them before their beards began to appear.

Althæa (*al-thē'a*).—Wife of Œneus and mother of Meleager (*q.v.*).

Amalthea (*am-al-thē'a*).—Nurse of the infant Jupiter in Crete, whom she fed with goat's milk. Jupiter broke off one of the horns of the goat and gave it the power of becoming filled with whatever the possessor might wish; hence it was called the *cornucopia*—i.e., horn of plenty.

Amazones (*a-māz'on-ēz*).—The Amazones, a mythical race of warlike women living near the river Thermodon. The female children had their right breasts cut off that they might use the bow with greater ease; hence their name *Amazon*, which means, "without breast." One of the twelve labors of Hercules was to obtain the girdle of Hippolyte, the queen of the Amazons. They came, under their queen, Penthesilea, to the assistance of Priam in the Trojan war; but she was killed by Achilles.

Amphion (*am-fī'ōn*).—Son of Jupiter and Antiope, and twin-brother of Zethus. They were born on Mount Cithæron, and were brought up by a shepherd. Amphion received a lyre from Mercury, on which he learned to play with marvelous skill. Amphion married Niobe (*q.v.*).

Amphitrite (*am-fi-trī'tē*).—Wife of Neptune and goddess of the sea. She was the mother of Triton.

Ancæus (*an-sē'us*).—One of the Argonauts. Having left a cup of wine untasted to pursue a wild boar, he was killed by it, which gave rise to the proverb. "There's many a slip twixt the cup and the lip."

Anchises (*an-kī'sēz*).—Son of Capys and Themis, the daughter of Ilus, king of Dardanus, on Mount Ida. He was so handsome that he was beloved by Venus, who became by him the mother of Æneas. On the capture of Troy by the Greeks, he was carried off on his son's shoulders from the burning city. He set forth with Æneas for Italy, but died and was buried in Sicily.

Androgeos (*an-droj'e-ōs*).—Son of Minos and Pasiphaë. Slain at the instigation of King Ægus, after having overcome all his opponents in the Panathenæa, at Athens. To avenge his death Minos made war on the Athenians, and compelled them to send every year to Crete seven youths and seven maidens to be devoured by the Minotaur (*q.v.*). Theseus, however, slew the monster, and so delivered them from the terrible tribute.

Andromache (*an-drom'a-kē*); literal meaning, "fighting with men."—Daughter of King Eëtion and wife of Hector, by whom she had a son, Scamandrius, or Astyanax. On the taking of Troy she fell to the lot of Neoptolemus (Pyrrhus), the son of Achilles, who took her to Epirus, and treated her as his wife. She afterwards married Hector's brother Helenus.

Andromeda (*an-drom'e-da*).—Daughter of Cepheus, king of Æthiopia, and Cassiopea. Her beauty was so great that her mother boasted that she surpassed in that respect the Nereids, the marine nymphs of the Mediterranean. Consequently, Neptune sent a sea-monster to lay waste the country. The oracle of Ammon promised deliverance, on condition that Andromeda was chained to a rock and left to the fury of the monster. This was done, but she was saved by Perseus (*q.v.*), who slew the monster and obtained Andromeda for his wife. Having been previously promised to her uncle Phineus, however, the latter appeared at the wedding, and a great fight ensued in which Phineus and all associated with him were slain. After her death Andromeda was placed among the stars.

Antæus (*an-tē'us*).—A giant of Libya (*i.e.* Africa), son of Neptune and Earth, who remained invincible so long as he touched his mother Earth. Hercules, having discovered this, held him up in the air and squeezed him to death.

Antenor (*ant-ē'nor*).—One of the wisest of the elders of Troy. When Menelaus and Ulysses came to Troy as ambassadors he received them, and advised the Trojans to give up Helen to Menelaus, which, however, they refused to do. When the city was captured by the Greeks Antenor's life was spared.

Aphrodite (*af-ro-di'tē*)—*i.e.* sea-foam.—The goddess of love and beauty, called Aphrodite by the Greeks, because she was supposed to have been born from the sea-foam. She was called Venus by the Romans. See "Venus."

Apollo (*a-poll'ō*).—The sun-god. He was the son of Jupiter and Latona, and twin-brother of Diana. Apollo was the god of music and the fine arts, of prophecy, and the god who protects flocks and cattle. He is also represented as taking great interest in the foundation and government of cities, and was looked upon as the god who punishes; hence carrying a bow and arrows. He had a celebrated oracle at Delphi. The invention of the flute and lyre was ascribed to Apollo. He was challenged to musical contests by Marsyas and Pan (see "Marsyas" and "Midas"). Apollo, as sun-god, is frequently called Phœbus—*i.e.* the bright one. There are several statues of Apollo, the most beautiful being the Apollo Belvedere at Rome.

Arachne (*ar-ak'nē*).—A Lydian maiden who so greatly excelled in the art of weaving that she challenged Minerva to a trial of skill. Being defeated, she hanged herself, and was changed by the goddess into a spider. This fable indicates that man learned the art of weaving from the spider, and that it was first pursued in Lydia. Arachne is the Greek word for spider.

Ares (*ā'rēz*).—The Greek god of war. See "Mars."

Arethusa (*a-re-thū'sa*).—One of the Nereids or marine nymphs of the Mediterranean. She was the nymph of the celebrated fountain of Arethusa in the island of Ortygia, near Syracuse. Arethusa was being pursued by the river-god Alpheus, when she was changed by Diana into the fountain of the same name.

Argonautæ (*ar-go-naw'tē*).—The Argonauts, or sailors of the Argo, were the heroes who went with Jason on the celebrated expedition to Colchis to recover the golden fleece. The origin of the expedition was as follows: Jason's father had been deprived of his kingdom by his half-brother Pelias, who also, to make himself more secure, attempted to take the life of Jason, then an infant. The latter, was, however, saved, and given over to the care of the centaur Chiron. When he grew up Pelias promised to surrender the kingdom to him on what he considered to be an impossible condition—namely that he brought him the golden fleece. This golden fleece (for the history of which see "Phrixus") was suspended to an oak in the grove of Mars, in Colchis, and was guarded day and night by a dragon. Jason at once undertook the enterprise, and instructed Argus, son of Phrixus, to build a ship with fifty oars, which he called the Argo, from the name of the builder. Minerva herself superintended the building of the ship. In the expedition Jason was accompanied by all the great heroes of the age—Hercules, Laertes, Theseus, Ajax, etc.—to the number of fifty. After an adventurous voyage they at length arrived at their destination. Æëtes (*q.v.*), king of Colchis, on learning the object of their visit, promised to give up the golden fleece if Jason would perform the following feats: first, tame two bulls, which had brazen feet and vomited fire, and yoke them to a plow; second, sow the unused teeth of the dragon slain by Cadmus (*q.v.*), from which armed men would spring, and slay them with his own hand; third kill the dragon who guarded the fleece. Medea, daughter of Æëtes, who was well skilled in magic, enabled Jason, with whom she had fallen in love, to do all these things; and, after taking the treasure, he and his Argonauts and Medea embarked by night and sailed away. After another eventful journey they finally reached Colchis again.

Argus (*ar'gus*).—A being with a hundred eyes; hence called "Panoptes" (*pan-op'tēz*).—*i.e.* the all-seeing. Juno appointed him to watch over the cow into which Io had been changed; but Mercury, at the command of Jupiter, lulled him to sleep by playing on his flute, and then cut off his head. Juno transplanted his eyes to the tail of the peacock, her favorite bird.

Ariadne (*ar-i-ad'nē*).—Daughter of Minos and Pasiphaë. When Theseus was sent as part of the yearly tribute of seven youths and seven maidens to be devoured in the labyrinth by the Minotaur, Ariadne fell in love with him, and gave him the clue of thread, by means of which he escaped from the labyrinth. Theseus promised to marry her, and they left Crete together; but he deserted her in Naxos, where she was found by Bacchus, who made her his wife. At their marriage he gave her a crown of seven stars, which after her death was made a constellation.

Aricia (*a-rī'si-a*).—A town of Latium, sixteen miles from Rome, near which was a celebrated grove and temple of Diana.

Arion (*a-rī'on*).—A celebrated lyric poet and cithara player of Methymna, in Lesbos, about B. C. 625. Once, when returning from a successful musical contest in Sicily, the sailors, in order to possess themselves of his presents, were about to murder him, but, on his urgent entreaty, allowed him to play once more on his cithara. He then invoked the gods, and threw himself into the sea. He was not drowned, however, for one of a number of dolphins that had been attracted round the vessel by his sweet strains took him on his back and bore him safely to land.

Aristæus (*ar-is-tē'us*).—Son of Apollo and Cyrene, who is said to have taught men the management of bees, and to have first planted olive trees. He was, after his death, worshiped as a god, and regarded as the protector of flocks and shepherds, of vine and olive plantations.

Artemis (*ar'tem-is*).—The Greek name of Diana (*q. v.*).

Ascanius (*as-kā'ni-us*).—Son of Æneas and Creusa, afterwards called Iulus. He founded Alba Longa, and was succeeded on the throne by his son Silvius.

Asgard.—In Scandinavian mythology Asgard represents the city of the gods, situated at the center of the universe, and accessible only by the bridge Bifrost *i. e.*, the rainbow.

Asir.—In northern mythology the most powerful, though not the oldest, of the deities; usually reckoned as twelve gods and twelve goddesses. The gods are Odin, Thor, Baldur, Niörd, Frey, Tyr, Bragi, Heimdall, Vidar, Vali, Ullur, and Forseti; the best-known of the goddesses, Frigga, Freyja, Iduna, and Saga.

Assaracus (*as-sar'a-cus*).—King of Troy, son of Tros, father of Capys, the father of Anchises.

Astarte (*as-tar'tē*).—A powerful goddess of Syria, corresponding to the Roman Venus.

Astræa (*as-trē'a*).—Goddess of justice, daughter of Jupiter and Themis; lived during the golden age among men.

Astræus (*as-trē'us*).—A Titan, husband of Aurora (the goddess of the dawn), and father of the winds and the stars.

Astyanax (*as-tī'an-ax*)—*i. e.* lord of the city.—A name given by the people of Troy to Scamandrius (or Scamander), son of Hector and Andromache, because his father was the protector of Troy. His mother saved him from the flames at the fall of Troy, but the Greeks hurled him down from the walls.

Atalanta (*at-a-lan'ta*).—A maiden of great beauty and exceedingly swift of foot, who determined to live in celibacy. She was the daughter of Iasus and Clymene, and was exposed by her father in her infancy. She was, however, suckled by a she-bear, the symbol of Diana. She took part in the celebrated Calydonian boar hunt, and received the boar's hide from Meleager, who slew the animal. She was subsequently recognized by her father, who desired her to marry. She agreed to do so on condition that every suitor should run a race with her, and that the first that outran her should be her husband, but all those whom she beat in the race should be put to death. In this way many suitors perished; but at last came Milanion (*mī-lan'i-on*), who, with the aid of Venus, reached the goal first, and was rewarded with her hand. The goddess gave him three golden apples, which he dropped during the race, one after the other. Attracted by their beauty, Atalanta stopped to pick them up, thus enabling Milanion to reach the goal first. "Atalanta's race" has formed the subject of several magnificent pictures.

Athamas (*ath'am-as*).—King of Orchomenus, in Bœotia. He married Nephele, who bore him Helle and Phrixus. He fell in love, however, with Ino, daughter of Cadmus, whom he married, and became by her the father of Melicertes and Learchus. As he had married Nephele at the command of Juno, he thus incurred the wrath of both Juno and Nephele, and was seized with madness. In this state he slew his son Learchus. Ino and Melicertes then leaped into the sea and became changed into marine deities, Leucothea and Palæmon respectively.

Athena (*a-thē'na*).—The great divinity of the Greeks, corresponding to the Roman Minerva (*q. v.*).

Athenæum (*a-thē-nē'um*).—A school founded by the emperor Hadrian at Rome, about A. D. 133, for the advancement of literature and philosophy. The name Athenæum means a place sacred to Minerva, who was the goddess of wisdom.

Atlas (*at'las*).—A Titan, son of Japetus and Clymene, and brother of Prometheus and Epimetheus. It is related that Perseus, after his conquest of the Gorgons, asked Atlas to shelter him, which Atlas declined to do. Whereupon Perseus, by exposing Medusa's head, changed him into the mountain Atlas (in the northwest of Africa), on which rested heaven and all the stars. Atlas married Pleione (*plē'i-ō-nē*), daughter of Oceanus, and became by her the father of the Pleiades (*plē'i-a-dēz*).

Atreus (*ā'trūs*).—Son of Pelops and Hippodamia, and brother of Thyestes. By his first wife, Cleola, he was the father of Plisthenes, and by his second—Aërope, widow of his son Plisthenes—the father of the heroes Agamemnon and Menelaus, and a daughter, Anaxibia. Atreus became king of Mycenæ. His brother, Thyestes, having seduced his wife Aërope, Atreus banished him. Thyestes then sent, from his place of exile, Atreus's son Plisthenes to slay his own father, but the converse actually took place, Atreus unwittingly killing his son. Atreus took terrible revenge on Thyestes for this. He recalled him to Mycenæ, and in a banquet placed before him the flesh of Thyestes' two sons, whom he had slain, and Thyestes unknowingly partook of the horrible repast. After the feast, Atreus produced the heads of Thyestes' sons, and convinced him of what had been done. Thyestes fled with horror, and the gods cursed Atreus and his house. The country was now visited by famine, and Atreus, following the advice of the oracle, went in search of Thyestes. In the course of his wanderings he married, as his third wife, Thyestes' daughter Pelopia, thinking she was the daughter of Thesprotus. Pelopia became, by her own father, the mother of Ægisthus, who afterwards slew his uncle, Atreus, because the latter had commanded him to kill his father, Thyestes. This tragic story forms the foundation of several Greek plays.

Atropos (*at'rop-os*).—One of the Fates or Parcæ (*q.v.*).

Atys (*ā'tis*).—A beautiful shepherd of Phrygia, beloved by Cybele (*sib'el-ē*). Having proved unfaithful, the goddess caused him to become mad, and he was changed into a fir tree.

Augeas (*aw'je-as*), or **Augias** (*aw-jī'as*).—A king of Elis, whose stable, containing three thousand head of cattle, uncleansed for thirty years, was cleaned out in one day by Hercules (*q.v.*).

Aulis (*aw'lis*).—A harbor in Bœotia, where the Greek fleet assembled before sailing for Troy.

Aurora (*aw-ror'a*).—The goddess of the dawn, called Eos (*ē'ōz*) by the Greeks; daughter of Hyperion and Thia, wife of Tithonus. She is represented as rising, at the close of every night, from the river Oceanus, in her rose-colored chariot drawn by swift horses, and opening with her rosy fingers the gates of the East. She bore Memnon to Tithonus.

Auster (*aws'ter*); the Greek *Notus*, the southwest wind. In the winter it brought fogs and rain; but in the summer it was a harmful dry and parching wind.

Autolycus (*aw-tol'ik-us*).—A very dexterous robber, who could transform himself into various shapes. He was the son of Mercury (the god of cunning and theft) and Chione (*ki'on-ē*), and the father of Anticlea, the mother of Ulysses, who was celebrated for his cunning.

Avatar.—The incarnation or descent of the deity Vishnu, of which nine are believed to be past, and the tenth is yet to come, when Vishnu will descend from heaven on a white-winged horse, and introduce on earth a golden age of virtue and peace.

Avernus lacus (*a-ver'nus lā'kus*).—Lake Avernus. A lake near Cumæ, enclosed by steep and wooded hills, whose deadly exhalations were said to kill the birds flying over it. Near it was the cave of the Sibyl, through which Æneas (see *Æneid*, Book VI.) descended to the lower world. Sometimes Avernus is used to mean the lower world itself. In the latter sense it is used in the well-known quotation, *Facilis descensus Averno*, "The descent to hell is easy."

Azazel.—Ewald considers Azazel to have been a demon belonging to the pre-Mosaic religion. Another opinion identifies him with Satan, or the devil. Milton makes him Satan's standard bearer.

Azrael.—Meaning in Hebrew "help of God." In the Jewish and the Mohammedan mythology, the name of an angel who watches over the dying, and separates the soul from the body.

B

Baal.—A sun god, the center of whose worship was Phœnicia, whence it spread to neighboring countries.

Bacchantes (*bak-an'tez*), or **Bacchæ** (*bak'ē*).—Priestesses of Bacchus.

Bacchus (*bak'us*); called Dionysus (*dī-on-ī'sus*) by the Greeks. The god of wine; was the son of Jupiter and Semele, the daughter of Cadmus. Bacchus went on a traveling expedition through Syria and Asia, returning to Europe through Thrace, during which he taught men the cultivation of the vine and the elements of civilization. He married Ariadne (*q.v.*). Feasts in honor of Bacchus were called Bacchanalia, and were of a very noisy and riotous character. The vine, ivy and laurel were sacred to him, as were also the tiger, lynx, panther, ass, serpent and dolphin. Rams were usually sacrificed to his honor.

Banshee.—The domestic spirit of certain Irish or Scottish families, supposed to wail shortly before the death of one of the family. The banshee is allowed only to families of pure stock.

Baldur (*bâl'dör,*) or **Balder** (*bâl'der*).—In old Norse mythology, a son of Odin, and one of the principal gods. Baldur's characteristics are those of a sun-god. He is the "whitest" of the gods, and so beautiful and bright that a light emanates from him. He is

the wisest, most eloquent and mildest of the Æses. His dwelling is Breidablik. His wife is Nanna. He is finally slain, at the instigation of Loki, by a twig of mistletoe in the hands of the blind god Hodur. Baldur is specifically a Northern god; among the other Germanic races there is no existing record of him whatsoever.

Bellerophon (*bel-ler'o-fon*).—Son of Glaucus and grandson of Sisyphus. He incurred the hatred of Antea, wife of Proetus, king of Argos, who sent him to his father-in-law (Iobates) with a letter requesting the latter to put the young man to death. Iobates selected what seemed to be a sure method of compassing his death, by asking him to go and kill the Chimæra (*kī-mē'ra*) (*q.v.*). Bellerophon, however, obtained possession of the winged horse Pegasus (*q.v.*), which enabled him to rise in the air. He then slew the monster with his arrows. Iobates then sent him against the Solymi, a warlike race in Lycia, and afterwards against the Amazons; but in these expeditions also he was successful. Finally, he attempted to fly to heaven on Pegasus; but Jupiter sent a gad-fly to sting the horse, which threw its rider on to the earth.

Bellona (*bel-lō'na*).—The Roman goddess of war, sister of Mars.

Belphegor.—A god of evil, worshiped by the Moabites. An archfiend who had been an archangel.

Belus.—The name of the Chaldean sun-god.

Berg Folk.—Pagan spirits doomed to live on the Scandinavian hills till the day of redemption.

Bertha.—The white lady who guards good German children, but is the terror of the bad, who fear her iron nose and big feet. Corresponds to the Italian La Befana.

Bheem.—One of the five brotherhoods of Indian demigods, famous for strength.

Bifrost.—In Norse mythology, a bridge between earth and heaven, over which none but the gods could travel. It leads to the palace of the Fates.

Bilskirnir.—A wonderful palace built by Thor for the use of peasants after death

Bona Dea (*bon'a de'a*), or **Fauna,** or **Fatua.**—A Roman goddess, sister, wife or daughter of Faunus. She was the goddess of chastity and prophecy, and revealed her oracles to females only. During her annual festival on the first of May, in the house of the consul or prætor, no male person was allowed to be present.

Boreas (*bor'e-as*).—The north wind; was the son of Astræus and Aurora, and brother of the other three winds, Notus, Zephyrus and Hesperus. He was worshiped at Athens, where a festival was celebrated in his honor.

Bosphorus, or **Bosporus.**—The Straits of Constantinople, so called from Io, who, in the form of a heifer, swam across it (Bosphorus=Ox-ford). See "Io."

Brahma.—The supreme god of the Hindus, represented with four heads and four arms. He is regarded as the creator of the universe, and forms, with Vishnu the preserver, and Siva the destroyer, the divine triad.

Briareus (*brī-ār'e-us*).—A hundred-armed giant, also called Ægæon (*q.v.*). Pope thus expresses his admiration for Handel:—

"Strong in new arms the giant Handel stands,
Like bold Briareus with a hundred hands."

Briseis (*brī-sē'is*).—Daughter of Brises and beloved by Achilles. She was the occasion of a feud between Achilles and Agamemnon.

Bucephalus (*bū-sef'a-lus*)—*i. e.* bull-headed. The favorite charger of Alexander the Great, so named because he was branded with a bull's head. No one but Alexander was able to mount this celebrated horse, which always knelt down to receive his master. He died in India after carrying Alexander through all his campaigns. Alexander built a city near the place where he died, and named it Bucephala in memory of him.

Busiris (*bū-sī'ris*).—A king of Egypt who cruelly sacrificed strangers to Jupiter. He attempted to sacrifice Hercules, but the latter slew him and all his ministers.

Buto (*bū'tō*).—An Egyptian goddess identified with Latona.

C

Cacus (*kā'kus*).—Son of Vulcan; a huge giant and notorious robber; lived in a cave on Mount Aventine. He stole the oxen of Hercules, which the latter had taken from Geryon, in Spain, whereupon Hercules slew him.

Cadmus (*kad'mus*).—Son of the Phœnician king Agenor, and brother of Europa. His father sent him to search for his sister, who had been carried off by Jupiter, and he was directed to follow a certain cow, and to build a city on the spot where the cow fell down with fatigue. In this way he became the founder of Thebes, in Bœotia. Near this place was a well guarded by a dragon, which Cadmus slew, and sowed the teeth of the monster. From these arose armed men, who killed each other, with the exception of five, who were the ancestors of the Thebans. All this he did on the direction of Minerva, and Jupiter gave him Harmonia for his wife. The marriage was celebrated in the citadel of Thebes, and all the Olympian gods were present at the ceremony. Cadmus gave Harmonia a famous robe of state (peplus) and a necklace (see "Harmonia") which he had received from Vulcan. Their children were Autonoë, Ino, Semele, Agave, Polydorus and Illyrius. Cadmus introduced among the Greeks an alphabet of sixteen letters.

Cæneus (*sē'nūs*).—Originally a maiden, named Cænis, who was beloved by Neptune and changed by him into a boy, and at the same time made invulnerable. In the lower worlds she recovered her female form.

Calchas (*kal'kas*).—The most eminent of the Greek soothsayers at the siege of Troy. He died of grief on meeting Mopsus, who was a wiser soothsayer, and predicted things which Calchas could not.

Calliope (*kal-lī'op-ē*).—The Muse of epic poetry. See "Musæ."

Callirrhoe (*kal-lir'ro-ē*).—Second wife of Alcmæon. She induced her husband to get the peplus and necklace of Harmonia, whereupon he was slain. See "Alcmæon."

Callisto (*kal-lis'tō*).—An Arcadian nymph beloved by Jupiter, by whom she became the mother of Arcas. Jupiter changed her into a she-bear, and afterwards placed her among the stars as *Ursa major.*

Calpe (*kal'pē*).—One of the Pillars of Hercules; now Gibraltar.

Calydon (*kal'i-dōn*).—A very ancient town in Ætolia. In the mountains around it the celebrated *Calydonian Boar Hunt* took place. The story is as follows: During the reign of Œneus, king of Calydon, Diana sent a huge boar to devastate the country, because the king had neglected her divinity. All the heroes of the age joined together for the purpose of killing this boar. Meleager, son of Œneus, slew the boar, and gave its hide to Atalanta, with whom he was in love. See "Atalanta."

Calypso (*kal-ip'sō*).—A nymph who ruled in the island of Ogygia, on which Ulysses was shipwrecked on his journey home from Troy. She desired Ulysses to marry her, and detained him on the island for seven years.

Camenæ (*kam-ē'nē*).—Originally prophetic nymphs belonging to the religion of ancient Italy, afterwards identified with the Muses.

Campus Martius (*kam'pus mar'shi-us*)—*i. e.* the plain of Mars; so named because it was consecrated to the god Mars. An open plain outside the walls of Rome, where the Roman youths performed their gymnastic and warlike exercises, and where the Roman people met for the purpose of electing magistrates.

Capitolium (*kap-it-ō'li-um*).—The temple of Jupiter and the citadel of Rome.

Cassandra (*kas-san'dra*).—Daughter of Priam, king of Troy, and Hecuba. She possessed great beauty, and was beloved by Apollo, who bestowed on her the gift of prophecy. She disappointed him, however, whereupon the god ordained that no one should believe her predictions. On the fall of Troy she fell to the share of Agamemnon, who took her to Mycenæ, where she was murdered by Clytæmnestra.

Castor and **Pollux** (*kas'tor, pol'luks*).—Twin brothers, often called the Dioscuri (*di-os'ku-rī*), *i. e.* sons of Zeus (Jupiter), because they were the sons of Jupiter and Leda, the wife of Tyndareus, king of Sparta. Castor was famous for his skill in managing horses, and Pollux for his ability as a boxer. Castor was supposed to be mortal, while Pollux was immortal. They took part in the celebrated expedition of the Argonauts, and assisted the Romans against the Latins in the great battle of Lake Regillus. They were greatly attached to each other, and were placed by Jupiter among the stars as Gemini (*jem'in-ī*), *i. e.* twins, where they served as a guide to mariners. They were worshiped more especially as the protectors of sailors.

Cauther.—In Mohammedan mythology the lake of paradise, whose waters are as sweet as honey, as cold as snow, and as clear as crystal; and any believer who tastes thereof is said to thirst no more.

Cecrops (*sē'krops*).—The most ancient king of Attica, founder of Athens. He decided in favor of Athena (Minerva) when she and Neptune contended for the possession of Attica. The citadel of Athens was called Cecropia after him.

Celeus (*sel'e-us*).—King of Eleusis, husband of Metanira, and father of Triptolemus and Demophon. He entertained the goddess Ceres, who in return taught his son Triptolemus (*q.v.*) agriculture.

Centauri (*sen-taw'rī*), or **Centaurs**—*i. e.* the bull-killers—were a fabulous race living in Thessaly, half men and half horses. They were defeated in a famous fight with the Lapithæ (*q.v.*), and expelled from their country. Chiron (*kī'ron*) was the most celebrated of them (*q.v.*).

Cephalus (*sef'al-us*).—Was beloved by Aurora, whose advances he rejected from love of his wife Procris. Aurora asked him to try the fidelity of Procris. Having metamorphosed him into a stranger, he appeared, laden with rich presents, before her. The presents caused her to yield, whereupon her husband discovered himself. She fled in shame to Crete, but afterwards returned, disguised as a youth, with a dog and spear (the gifts of Diana) that never missed their object. To obtain these, Cephalus promised to love the youth, who then made herself known to him as his wife Procris. In this way a reconciliation was effected. Afterwards Cephalus, while out hunting, accidentally killed her with the never-erring spear.

Cepheus (*sē'fūs*).—King of Ethiopia and father of Andromeda.

Cerberus (*ser'ber-us*).—The three-headed dog that guarded the entrance to the lower world.

Ceres (*sē'rēz*).—The goddess of agriculture, expecially of the cultivation of corn; called Demeter (*dē-mē-tēr*) by the Greeks. She was the daughter of Saturn and Rhea, and sister of Jupiter and Pluto. She became by Jupiter the mother of Proserpine. The latter was carried off by Pluto. When Ceres found this out, she did not allow the earth to bring forth any fruits, and Jupiter was compelled to send Mercury into the lower world to fetch back Proserpine. Pluto consented, but gave Proserpine part of a pomegranate to eat. In consequence of this she was obliged to spend one-third of the year with Pluto. The earth then brought forth fruit again. This legend evidently refers to the concealment of seed-corn in the earth and its subsequent reappearance above the surface. The Romans sacrificed pigs to Ceres. The decrees of the senate were deposited in her temple.

Ceyx (*sē'ix*).—Son of Lucifer and husband of Alcyone.

Charites (*char'it-ēz*)—Gr., the **Graces**—were the goddesses who confer all grace. They were the daughters of Jupiter and were three in number, their names being Aglaia (*ag-lā'i-a*), *i. e.* the bright one; Euphrosyne (*ū-fros'i-nē*), *i. e.* the cheerful or mirthful one; and Thalia (*thal-ī'a*), *i. e.* the blooming one. They were the personifications of grace and beauty, and enhanced by refinement and gentleness the enjoyments of life. They were the friends of the Muses and specially favored poetry.

Charon (*kăr'on*).—Son of Erebus; was the ferryman of Hades who conveyed the souls of the departed across the rivers Acheron and Styx, receiving in return the obolus placed in the mouth of every corpse before burial.

Charybdis (*ka-rib'dis*).—A dangerous whirlpool between Italy and Sicily, opposite Scylla (*q.v.*).

Chibiabos.—A musician, ruler in the land of spirits, and friend of Hiawatha. Personification of harmony in nature.

Chimæra (*ki-mē'ra*)—*i. e.* a she-goat.—A fabulous, fire-breathing monster with a lion's head, a serpent's tail, and a *goat's* body. She was killed by Bellerophon, mounted on Pegasus. The myth relates to a volcano in Lycia.

Chione (*ki'on-ē*).—Daughter of Dædalion. She was shot by Diana because she compared her beauty with that of the goddess.

Chiron (*kī'ron*).—A centaur famous for his knowledge of medicine, plants, music and divination. Son of Saturn and Philyra, the tutor of Æsculapius, Achilles and Hercules. Being accidentally wounded by one of the poisoned arrows of Hercules, he gave up his immortality and was changed into the constellation Sagittarius.

Chloris (*klor'is*).—The Greek goddess of flowers, identical with Flora.

Chou.—An Egyptian god corresponding to the Roman Hercules.

Circe (*sir'sē*).—Daughter of Helios (the sun) and Perse, famous for her magic arts. She lived on the Island of Ææa, on which Ulysses was cast on his voyage home from Troy. Circe met his companions, whom he had sent to explore the country, and offered them a magic cup, on tasting which they all became, with the single exception of Eurylochus, changed into swine. Ulysses, on hearing of it, obtained from Mercury the root *moly*, which fortified him against enchantment, and compelled Circe to restore his companions to their former shape. He then remained with her for a year, and she bore him a son, Telegonus.

Clio (*klī'o*).—The Muse of history. See "Musæ."

Clotho (*klō'tho*).—The spinner of the thread of life; one of the Fates. See "Parcæ."

Clusium (*klū'si-um*).—One of the oldest and most important of the twelve Etruscan cities, the residence of Porsena, in the neighborhood of which was the famous sepulchre of this king in the form of a labyrinth.

Clytæmnestra (*klī-tem-nes'tra*).—Daughter of Tyndarus and Leda, and sister of Helen, Castor and Pollux; wife of Agamemnon, and mother of Orestes, Electra and Iphigenia. While her husband was absent at Troy she lived with Ægisthus, and on his return the guilty pair murdered him. In revenge for this deed, her own son Orestes put her to death.

Cnidus (*knī'dus*), or **Gnidus.**—A city on the south-western coast of Caria, in Asia Minor, highly celebrated for the statue of Venus, by Praxiteles, the famous sculptor, which stood in her temple there.

Cocytus (*ko-sī'tus*)—*i. e.* the river of wailing. A river in the lower world.

Colchis (*kol'chis*).—A country in Asia, lying on the eastern part of the Black Sea, celebrated on account of the Golden Fleece (see "Argonautæ").

Comus (*kō'mus*).—The god of mirth and joy, represented as a winged youth.

Concordia (*kon-kor'di-a*).—The Roman goddess of concord. Camillus, in B. C. 367, erected a temple in her honor to celebrate the reconciliation between the patricians and plebians.

Corybantes (*kor-i-ban'tes*).—Priests of Cybele (*sib'el-ē*), or Rhea, in Phrygia, who worshiped her with riotous dances to the sound of cymbals.

Creusa (*kre-ū'sa*).—Daughter of Priam and Hecuba, wife of Æneas, and mother of Ascanius. She perished at the capture of Troy.

Cronos (*kron'os*).—The Greek divinity corresponding to the Roman Saturnus (*q.v.*).

Cumæ (*kū'mē*).—A very ancient town on the coast of Campania, said to have been founded B. C. 1050. It was celebrated as the residence of the earliest Sibyl. Tarquinius Superbus died here.

Cupido (*kū-pī'dō*), or **Cupid** (*kū'pid*); called Eros (*er'ōz*) by the Greeks. The god of love, son of Venus, his father being either Jupiter, Mars or Mercury. He is represented as a boy with golden wings, armed with a bow and a golden quiver full of arrows. He is so mischievous that he shoots his arrows at gods and men alike. Sometimes his eyes are covered, so that he acts blindly. He is the usual companion of his mother.

Cybele (*sib'e-lē*); called Rhea (*rē'a*) by the Greeks. A goddess, originally Phrygian, regarded as goddess of the earth. She was daughter of Uranus (*ū'ran-us*) and Ge (*jē*), and the wife of Saturn, and the mother of Jupiter, Juno, Pluto, Neptune, Ceres and Vesta. As Saturn devoured all her children, Cybele, just before the birth of Jupiter, went to Crete. When Jupiter was born, she gave Saturn a stone wrapped up like an infant, which the god, supposing it to be the child, swallowed. Cybele is usually figured seated on a throne and having a crown of towers on her head. She is frequently referred to as the "tower-crowned Cybele." The lion was sacred to her.

Cyclopes (*sī-klō'pēz*), or **Cyclops** (*sī'klops*)—*i. e.* beings with one *circular eye* in the middle of their foreheads. These were a fabulous race of giants living in Sicily. They were shepherds, but devoured human beings. They were also Vulcan's workmen, volcanoes, especially Mount Ætna in Sicily, being regarded as their workshops, in which they made the armor for gods and heroes. The chief among them was Polyphemus (*q.v.*).

Cyllene (*sil-lē'nē*).—The highest mountain in Peloponnesus, on which Mercury was born.

Cynthus (*sin'thus*).—A mountain of Delos, celebrated as the birthplace of Apollo and Diana, who are hence called, respectively, Cynthius and Cynthia (*sin'thi-a*).

Cyprus (*sī'prus*).—A large island in the Mediterranean, renowned in ancient, no less than in modern, times for its fertility. It was one of the chief seats of the worship of Venus.

Cythera (*si-thē'ra*).—An island in the Ægean Sea, celebrated for the worship of Venus.

D

Dædalus (*dē'da-lus*).—A mythical personage skillful as a sculptor and architect. He made the wooden cow for Pasiphaë, and when Pasiphaë gave birth to the monster, the Minotaur, Dædalus constructed the labyrinth in which it was kept. For doing this Minos, king of Crete, imprisoned him; but he escaped, and as Minos had seized all the ships on the coast of the island, Dædalus made wings for himself and his son Icarus, and they flew away. Dædalus flew safely

over the Ægean, alighting at Cumæ, in Italy; but Icarus was slower in his flight, and the rising sun melted the wax by which the wings were fastened to his body, and he fell into the sea and was drowned; hence that part of the sea was called *Icarian*.

Danae (*dan'a-ē*).—Daughter of Acrisius, king of Argos. Her father confined her in a brazen tower, as an oracle declared that she would have a son that would kill his grandfather. Here, however, Jupiter visited her in a golden shower, and she became the mother of Perseus. Acrisius then shut up mother and child in a chest, which he threw into the sea; but Jupiter caused the chest to come ashore at the island of Seriphos, when Dictys, a fisherman, found them and took them to the king of the country. See "Perseus."

Danai (*dan'a-ī*).—The Greeks. See "Danaus."

Danaides (*dan-ā'i-dēz*).—The fifty daughters of King Danaus (*q.v.*).

Danaus (*dan'a-us*).—Son of Belus and twin-brother of Ægyptus (see "Ægyptus"). Lynceus, son of Belus, whose life was spared by Hypermnestra, avenged the death of his brothers by killing his father-in-law, Danaus. The fifty daughters of Danaus—called the Danaides—were punished in the lower world by being compelled everlastingly to pour water into a sieve. From Danaus, who was king of Argos (which was the most ancient city of Greece), the Greeks collectively were called Danai.

Daphne (*daf'nē*).—Daughter of the river-god Peneus. Her great beauty attracted the god Apollo, who pursued her; but just as she was being overtaken her prayer for aid was answered by her being changed into a laurel tree, the Greek word for which is Daphne. This tree consequently became the favorite tree of Apollo and was sacred to him.

Dardanus (*dar'dan-us*).—Son of Jupiter and Electra, the mythical ancestor of the Trojans.

Deianira (*dē-ya-nī'ra*).—Daughter of Œneus and wife of Hercules. She was beloved by the river god Achelous and by Hercules; but Hercules overcame his opponent in a fight for her, and obtained her as his wife. She accidentally killed her husband by giving him a poisoned garment to wear, and on seeing what she had done hanged herself (see "Hercules").

Deidamia (*dē-id-a-mī'a*).—Daughter of Lycomedes, at whose court Achilles was concealed in maiden's attire. She became, by Achilles, the mother of Pyrrhus or Neoptolemus.

Deiphobus (*dē-if'ob-us*).—Son of Priam and Hecuba. After the death of Paris he married Helen. He was killed in a barbarous manner by Menelaus, Helen's first husband.

Delos (*dē'los*).—The smallest of the Cyclades (islands), the birthplace of Apollo and Diana, and the most holy seat of the worship of the former.

Delphi (*del'fī*).—A small town in Phocis, very celebrated on account of its oracle of Apollo. Homer always refers to it under its old name, Pytho. It was looked upon as the central point of the whole earth, and was hence called "the navel of the earth." The oracle was consulted in the center of the splendid temple of Apollo. Here there was a small opening in the ground, from which a mephitic vapor occasionally arose. A tripod was placed over this opening, and the priestess—called Pythia, from Pytho—sat on it. In this way she inhaled the vapor, and the words she then uttered were believed to be inspired by Apollo. The priests took the words down and communicated them to the persons who had desired to consult the oracle.

Demeter (*dē-mē-tēr*). See "Ceres."

Deucalion (*dū-kā'li-on*).—Son of Prometheus, king of Phthia, in Thessaly, and husband of Pyrrha. He and his wife were the only human survivors of a great deluge which Jupiter sent to destroy mankind. They were preserved during the nine days' flood in a ship which Deucalion built on the advice of his father. The ship finally rested on Mount Parnassus, in Phocis. On the direction of Themis, Deucalion and his wife threw "the bones of their mother," *i. e.* the stones of the earth, behind them, those thrown by Deucalion becoming men, and those thrown by Pyrrha becoming women. In this way the earth was repeopled.

Diana (*dī-ā'na*).—Twin-sister of Apollo, the virgin goddess of the moon and of hunting, called by the Greeks Artemis (*ar'te-mis*). She was the daughter of Jupiter and Latona, and was born on the island of Delos. She is represented as armed with a bow, quiver and arrows, and was also regarded as identical with the moon (in Greek, Selene), her brother Apollo being looked upon as the sun (or Helois).

Dido (*dī'dō*).—Daughter of the Tyrian king Belus, and reputed founder of Carthage. Æneas, on his journey from Troy, landed at Carthage, and was handsomely entertained by Dido. She fell in love with the hero, and, on his leaving her to proceed to Italy, she, in despair, destroyed herself on a funeral pile. Dido is also called Elissa.

Diomedes (*di-o-mē'dēz*).—A famous hero at the siege of Troy. He was the son of Tydeus and Deïpyle, and is hence frequently called Tydides (*ti-dī'dēz*). Next to Achilles, he was the bravest hero in the Greek army. The gods themselves were supposed to be taking part in this memorable siege, some being ranged on one side and some on the other. Diomedes was under the special protection of Minerva. He not only engaged in conflict with the Trojan heroes, Hector and Æneas, but even wounded both Venus and Mars, who had espoused the cause of the Trojans. Diomedes and Ulysses carried off the palladium from the city of Troy, the safety of which was contingent on its possession (see "Troy"). At the end of the Trojan war he returned to Argos, where he found his wife (Ægialea) living in adultery with Hippolytus—a punishment visited upon him by the angry Venus. He consequently left Argos, and went to Ætolia. He afterwards settled at Daunia, in Italy, where he married Evippe, the daughter of Daunus, and died at an advanced age.

Dione (*dī-ō'nē*).—A female Titan who became, by Jupiter, the mother of Venus.

Dirce (*dir'sē*).—Wife of Lycus, king of Thebes, who married her after divorcing his former wife, Antiope (*an'ti-o-pē*). On account of the cruelty with which she treated Antiope, Amphion and Zethus—Antiope's sons by Jupiter—took terrible vengeance on Dirce. They tied her to a wild bull, which dragged her about till she perished, and then threw her body into a fountain near Thebes, which was from that time called the Fountain of Dirce.

Dis (*dis*).—A contraction of Dives, *i. e.* rich; the god of the infernal regions. See "Pluto."

Discordia (*dis-kor'di-a*); in Greek, Eris (*er'is*).—The goddess of strife or discord. She was the sister of Mars, and, with him, delighted in the noise and tumult of war. It was she who threw the celebrated golden apple into the assembly of gods, for a full account of the results of which see "Paris."

Donar.—A name given, sometimes, to Thor, the thunder-god, in Norse mythology.

Doris (*dōr'is*).—Daughter of Oceanus and Thetis. She married her brother Nereus (*q.v.*), and became the mother of the fifty Nereides.

Draupnir.—The marvelous ring belonging to Odin, with which he worked magic. It was burned on the funeral pyre of his son Balder.

Droma.—The chain forged for the purpose of binding the Fenris wolf, but which he broke. Hence the proverb, "to dash out of Droma."

Dryades (*dry'a-dez*), or **Dryads.**—Wood-nymphs. See "Nymphæ."

E

Echidna (*e-kid'na*).—A monster, half woman and half serpent. She was the mother of the Chimæra, Cerberus, the Lernean Hydra, and other monsters. She was killed in her sleep by Argus with the hundred eyes.

Echo (*ek'ō*).—A nymph who, because she kept Juno in incessant conversation while Jupiter was sporting with the nymphs, was punished by being changed into an echo. In this state she fell in love with Narcissus—a beautiful youth, who was incapable of the tender passion—and, as her love was not returned, she pined away till nothing remained but her voice.

Elbegast.—One of the dwarfs of Scandinavian mythology who dwelt in a magnificent palace underground, and drew their servants from the bosom of the earth.

Elberich.—In the German hero-legends a dwarf who aided the Lombard emperor Otnit to win the daughter of the soldan of Syria. He is identical with the Oberon of French and English fairy mythology.

Egil.—The Vulcan of northern mythology, one of the three brothers who married the swan-maidens. He was a great archer, killed his brother, Volünd, by command of the king, and himself later became a peasant.

Electra (*e-lek'tra*).—Daughter of Agamemnon and Clytæmnestra. She saved the life of her brother Orestes, and afterwards the two avenged the death of Agamemnon by slaying their mother, Clytæmnestra. See "Orestes."

Eira—An attendant of the goddess Fuigga, and a skillful nurse. She gathered herbs and plants for the cure of both sickness and wounds and taught the science to women.

Eleusis (*el-ū'sis*).—A very ancient city of Attica, famous for its mysteries of Ceres, to whom was erected a magnificent temple.

Elis (*ē'lis*).—A country on the west coast of the Peloponnesus. In it was Olympia, where every four years a splendid festival was held in honor of Jupiter.

Elysium (*e-lizh'i-um*).—The Elysian fields. That part of the lower world which forms the abode of the blessed.

Enceladus (*en-sel'ad-us*).—One of the hundred-armed giants who made war upon the gods. He was slain by Jupiter, and buried under Mount Ætna.

Endymion (*en-dim'i-on*).—A youth of surpassing beauty who so moved the cold heart of the virgin goddess of the moon (Diana or Selene), that she kept him in a perpetual sleep on Mount Latmus, in Caria, that she might kiss him without his knowledge.

Eos (*ē'ōz*).—See "Aurora."

Ephesus (*ef'e-sus*).—The chief of the twelve Ionian cities in Asia Minor, with a celebrated temple of Diana. The latter was regarded as one of the wonders of the world. It was always a very flourishing city, and was visited by St. Paul and St. John.

Elf.—The water sprite, known also as Elb, from which the name of the river Elbe is said to be derived. Elves are more properly known as mountain fairies, or those airy creatures that dance on the grass or sit in the leaves of trees and delight in the full moon.

Elivagar.—In Norse mythology the name of a great stream in Chaos, flowing from a fountain in the land of mist. This stream was much frequented by the elves at their creation.

Erato (*er'a-tō*).—The Muse of amatory poetry. See "Musæ."

Erebus (*er'e-bus*).—The god of darkness, son of Chaos and brother of Nox (night). The name signifies darkness, and is frequently used to designate the lower world.

Erechtheus (*e-rek'thūs*).—An ancient and mythical king of Athens. See "Athenæ."

Eridanus (*ē-rid'an-us*).—The Greek name of the river Padus (Po), into which Phaethon fell when struck by the lightning of Jupiter. See "Phaethon."

Erinyes (*er-in'i-es*).—The Furiæ (*q.v.*).

Erl-king.—Name given to the king of the elves, or a spirit of the air. According to tradition, its home is in the Black Forest of Germany, and it appears as a goblin, working harm and ruin, especially among children.

Eryx (*er'ix*).—A high mountain in the northwest of Sicily, on the summit of which stood an ancient and celebrated temple of Venus.

Eumenides (*ū-men'i-dēz*).—See "Furiæ."

Euphrosyne.—See "Charites."

Europa (*ū-rō'pa*).—The beautiful daughter of the Phœnician king Agenor. Jupiter was so charmed with her that he obtained possession of her by the following stratagem: He assumed the form of a bull among the herds of Agenor, and Europa and her maidens were delighted with the tameness of the noble animal, so much so that at length Europa ventured to mount his back, whereupon the god plunged into the sea and carried her over to Crete. Here Jupiter assumed his proper shape, and Europa bore him Minos, Rhadamanthus and Sarpedon.

Eurydice (*ū-rid'i-sē*).—Wife of Orpheus (*q.v.*).

Eurystheus (*ū-ris'thūs*).—Son of Sthenelus and grandson of Perseus, a king of Mycenæ. Jealous of the fame of Hercules, and wishing to destroy him, Eurystheus, at the command of Juno, imposed upon Hercules his famous twelve labors.

Euterpe (*ū-ter'pē*).—One of the Muses (*q.v.*).

F

Fada.—A fée or kobold of the south of France, sometimes called "Hada." These house-spirits, of which, strictly speaking, there are but three, bring good luck in their right hand and ill luck in their left.

Fafnir.—In northern mythology the eldest son of the dwarf king Hreidmar. The slaying of Fafnir is the destruction of the demon of cold or darkness who had stolen the golden light of the sun.

Fates.—See "Parcæ."

Faunus (*faw'nus*).—Son of Picus, grandson of Saturn, institutor of tillage and grazing, and after his death the protecting deity of agriculture and of shepherds, and also a giver of oracles. He is identical with the Greek god Pan, and is represented with horns and goat's feet.

Faustulus (*faws'tu-lus*).—A shepherd who brought up Romulus and Remus.

Flora (*flō'ra*).—The Roman goddess of flowers and spring.

Fortuna (*for-tū'na*); called Tyche (*tīk'ē*) by the Greeks. The goddess of fortune. She is variously represented: with the horn of plenty, indicative of the plentiful gifts of fortune; with a rudder, to signify that she guides the affairs of men; with a ball, emblematic of the shifting and changing character of the fickle goddess.

Freki and **Geri.**—The two wolves of Odin. When Odin, seated on his throne, overlooks heaven and earth, his two wolves lie at his feet.

Frey.—Scandinavian god of the sun and of rain, and hence of fertility and peace. He was one of the most popular of the northern divinities. No weapons were ever allowed in Frey's temple, although oxen and horses were sacrificed to him. His name was connected with the taking of any solemn oath, a heavy gold ring being dipped in the blood of the sacrifice and the oath sworn upon the ring. One of the most celebrated of the temples built to Frey was at Therva, in Iceland.

Freyja.—She was the sister of Frey, and the wife of Odur, who abandoned her on her loss of youth and beauty, and was changed into a statue by Odin, as a punishment. She is known as the northern goddess of beauty and love; plants were called Freyja's hair, and the butterfly, Freyja's hen.

Frigga.—In Scandinavian mythology the wife of Odin, the queen of the gods, and the mother of Baldur, Thor, etc. She sometimes typifies the earth, as Odin does the heavens. The Anglo-Saxons worshiped her as Frea. The name survives in Friday.

Frodi.—The son of Frey, a god of peace. Under his direction two giantesses turned a pair of magic millstones which ground out gold according to his wish and filled his coffers. Excited by greed he forced them to labor, allowing rest only long enough for the singing of one verse. When Frodi himself slept, the giantesses changed their song and proceeded to grind out an army of troops to invade the land. These troops represent the vikings.

Furiæ (*fū'ri-ē*).—The Furies; called Eumenides (*ū-men'i-dēz*), *i. e.* the gracious or well-meaning ones, by the Greeks; three goddesses of vengeance, whom the Greeks so much dreaded that they dared not to call them by their real names, hence referred to them by the euphemism Eumenides. The Romans also called them Diræ (*dī'rē*). Their names were Alecto (*a-lek'tō*), Megæra (*me-gē'ra*) and Tisiphone (*tī-sif'-onē*). They were the daughters of Earth or of Night, and were terrible winged maidens with serpents twined in their hair and with blood dripping from their eyes. They were stern and inexorable, punishing the guilty both in this world and after death. They dwelt in Tartarus —*i. e.* Hades. The sacrifices offered to them were black sheep and a drink of honey mixed with water, the latter, called a *libation* (*lī-bā'shun*), being poured forth out of a cup in their honor.

G

Galatea (*gal-a-tē'a*).—A sea nymph. See "Acis."

Ganesa.—Goddess of wisdom, in Hindu mythology.

Gangler.—The gate-keeper in Odin's palace who gave the explanation of the northern mythology that it might be recorded.

Ganymedes (*gan-i-mē'dēz*), or **Ganymede** (*gan'i-mēd*) —Son of Tros and Callirrhoe, a beautiful youth who was carried off by Jupiter's eagle from Mount Ida to heaven, that he might be cup-bearer to the gods in place of Hebe. Jupiter compensated his father by presenting him with a pair of divine horses.

Garm.—A fierce dog that kept guard at the entrance of Hel's kingdom, the realm of the dead. He could be appeased by the offering of a Hel-cake which always appeared in the hand of one who, on earth, had given bread to the needy.

Genius (*jē'ni-us*).—The protecting spirit or genius of a person, place, etc.; called by the Greeks Dæmon. They were represented as the guardians of men and of justice, and the Greek philosophers held that every human being at his birth had a dæmon assigned to him, which accompanied him throughout life. Every place, also, had its genius, which appeared in the form of a serpent eating fruit placed before him. In works of art genii are commonly represented as winged beings.

Gerda.—Wife of Frey, and daughter of the frost giant Gymir. She is so beautiful that the brightness of her naked arms illuminates both air and sea.

Giallar Bridge.—The bridge of death, over which all must pass.

Giallar Horn, The.—Heimdall's horn, which went out into all worlds whenever he chose to blow it. According to northern mythology, he blew a long-expected blast as a rallying call to the battle which ended the reign of the gods Odin, Frey, and Tyr.

Gian ben Gian.—In Arabia, king of the Ginns or Genii, and founder of the Pyramids. He was overthrown by Azazel or Lucifer.

Gigantes (*ji-gan'tēz*).—A fabulous race of huge beings, with terrible countenances and the tails of dragons. They endeavored to storm the heavens, being armed with huge rocks and trunks of trees; but the gods, with the assistance of Hercules, destroyed them all, and buried them under Ætna and other volcanoes. This story probably had its origin in volcanic convulsions.

Glaucus (*glaw'kus*).—(i) A fisherman who became a sea-god by eating a part of the divine herb sown by Saturn. (ii) Son of Sisyphus. Was torn to pieces by his own mares, because he had despised the power of Venus. (iii) The commander of the Lycians in the Trojan war. He was slain by Ajax.

Golden Fleece.—See "Argonautæ."

Gili.—The infernal river of Scandinavian mythology.

Ginungagap.—In Norse mythology the vast chaotic gulf of perpetual twilight which existed before the present world, and separated the region of fog from the region of heat. Giants were the first beings who came to life among the icebergs that filled this vast abyss.

Gorgons (*gor'gonz*).—Three frightful female monsters who turned all they looked upon into stone. Their names were Medusa (*me-dū'sa*), Euryale (*ū-ri'al-e*) and Stheno (*sthē'no*), and they were daughters of Phorcys and Ceto. Their heads were covered with serpents in place of hair, and they had wings, frightful teeth and brazen claws. Of the three, Medusa alone was mortal. She was killed by Perseus (*q.v.*).

Gladsheim.—The palace of Odin, in which were the great hall Valhalla (the hall of the slain) and the twelve seats occupied by the gods when holding council.

Glasir.—A marvelous grove in Asgard, in which the leaves were all of shimmering red gold.

Glendoveer.—In Hindu mythology is a kind of sylph, the most lovely of the good spirits.

Gnome.—One of a class of spirits or imaginary beings which were supposed to tenant the interior parts of the earth, and in whose charge mines, quarries, etc., were left. Rübezahl, of the German legends, is often cited as a representative of the class.

Goblins and Bogies.—Familiar demons of popular superstition, a spirit which lurks about houses. It is also called hobgoblin. Goblin is used in a serious sense by Shakespeare in *Hamlet*, where the ghost is supposed to be a "spirit of health or goblin damned."

Graces, The Three.—See "Charites."

Gradivus (*grad-i'vus*)—*i. e.* the marching one. A surname of Mars.

Græ (*grē'ē*), lit., "the old women" (Gr.).—So called because they had gray hair from their birth. They were the sisters of the Gorgons, and were three in number. They had but one eye and one tooth to use between them.

Gyas (*ji'as*), **Gyes** (*ji'ēz*), or **Gyges** (*ji'jēz*).—One of the giants with a hundred hands who made war upon the gods.

H

Hades (*hā'dēz*).—See "Pluto."

Hæmon (*hē'mon*).—Son of Creon, king of Thebes. He loved Antigone, and killed himself on hearing that she was condemned by Creon to be shut up in a subterranean cave.

Harmonia (*har-mō'ni-a*).—Daughter of Mars and Venus, and wife of Cadmus. On the wedding-day Cadmus received a necklace, which afterwards became famous, inasmuch as it became fatal to all who possessed it.

Harpocrates (*har-pok'ra-tēz*).—The god of mystery and silence, and, on that account, represented as having been born with his finger in his mouth. He was the son of Osiris. His statue stood at the entrance of most of the Egyptian temples.

Harpyiæ (*har'pi-ē*).—The Harpies—*i. e.* the Robbers or Spoilers, hideous rapacious monsters, half bird and half woman. They were three in number. Homer described them as carrying off people who had disappeared.

Hebe (*hē-bē*).—The goddess of youth, daughter of Jupiter and Juno. She was the cup-bearer to the gods, in which office she was afterwards supplanted by Ganymede. She became the wife of Hercules after he was deified.

Hecate (*hek'a-tē*).—Daughter of Perses and Asteria, the presider over enchantments, etc. She was looked upon as a kind of threefold goddess—viz., Luna (the moon) in heaven, Diana on earth, and Proserpine in the lower world—and is accordingly represented with three bodies or three heads. Dogs, honey and black female lambs were sacrificed to her.

Hector (*hek'tor*).—Eldest son of Priam, king of Troy, and Hecuba, and husband of Andromache. He was the chief hero of the Trojans in their war with the Greeks. He was slain in single combat by Achilles, who chased him thrice round the walls of the city, and, after having slain him, tied his body to his chariot and dragged it thrice round the walls. The character of Hector as a warrior, husband, father and son is very finely drawn by Homer in the *Iliad*.

Hecuba (*hek'u-ba*).—Wife of Priam, king of Troy. After the fall of Troy she was carried away as a slave by the Greeks and suffered great misfortunes.

Heimdall.—In northern tales a god who lived in the celestial fort Himinsbjorg, under the farther extremity of the bridge Bifrost, and kept the keys of heaven. He is the watchman or sentinel of Asgard, sees even in sleep, can hear the grass grow, and even the wool on a lamb's back. Heimdall, at the end of the world, will wake the gods with his trumpet.

Helena (*hel'en-a*), or **Helene** (*hel'en-ē*); commonly called Helen of Troy. Daughter of Jupiter and Leda, and sister of Castor and Pollux. She was the greatest beauty of her age, and her hand was sought by the noblest chiefs of Greece. She chose Menelaus (*men-e-lā'us*), and became by him the mother of Hermione. She eloped with Paris (*q.v.*) to Troy, and hence arose the Trojan war, as all the Greek chiefs, who had been former suitors of Helen, resolved to avenge her abduction, and sailed with Menelaus against Troy. After the death of Paris she married his brother Deiphobus (*de-if'ob-us*). On the capture of Troy, after a ten years' siege, she became reconciled to Menelaus, and returned with him to Sparta, where they lived for a number of years in peace and happiness.

Helenus (*hel'e-nus*).—A celebrated soothsayer, son of Priam, king of Troy, and Hecuba. He deserted his countrymen and joined the Greeks—some say voluntarily, others that he was taken prisoner by the Greeks.

Heliades (*hē'li-a-dēz*).—Daughters of the Sun (Helios). They lamented the death of their brother Phaethon so bitterly that the gods, in compassion, metamorphosed them into poplar trees and their tears into amber.

Helicon (*hel'i-kon*).—A mountain in Bœotia, sacred to Apollo and the Muses. The famous fountains of the Muses, Aganippe and Hippocrene, sprang here.

Helios (*hē'li-os*).—The god of the sun. See "Phœbus" and "Apollo."

Helle (*hel'lē*).—Sister of Phrixus (*q.v.*). When she and her brother were riding through the air upon the ram with the golden fleece she fell into the sea, which was thence called the Hellespont—*i. e.* the sea of Helle; now called the Dardanelles.

Hephæstus (*hē-fēs'tus*).—The god of fire. See "Vulcan."

Hera.—See "Juno."

Hercules (*her'kū-lēz*); called Heracles (*hē'ra-klēz*) by the Greeks.—The most celebrated hero of antiquity, noted especially for his Twelve Labors. He was the son of Jupiter and Alcmene. He showed his prowess at a very early age, for when the jealous Juno sent two serpents to destroy him as he lay in his cradle, the infant hero strangled them with his own hands. His first great adventure happened while he was tending the oxen of his supposititious father, Amphitryon, the husband of Alcmene. A huge lion devastated the flocks of Amphitryon and Thespius, king of Thespiæ. Hercules slew the lion, and thenceforth wore the skin as a garment, although some state that the lion's skin of Hercules was taken from the Nemean lion which Hercules killed as one of his labors. Next he defeated and killed King Erginus, to whom the Thebans paid tribute. Creon, king of Thebes, gave him his daughter Megara in marriage, and she bore him several children. Soon afterwards Juno drove him mad, and in this state he killed his children. His grief was so great that he went into voluntary exile and was purified by Thespius. He then consulted the celebrated oracle at Delphi as to where he should settle, and was ordered to live at Tiryns and to serve Eurystheus (*ū-ris'thūs*) for twelve years, after which he should become immortal. It was at the bidding of Eurystheus that he performed the following Twelve Labors. Hercules usually carried a huge club which he had cut for himself in the neighborhood of Nemea.

(i) *The fight with the Nemean lion.* Eurystheus ordered Hercules to bring him the skin of this monster. Finding his club and arrows useless, he strangled the animal with his own hands.

(ii) *The fight against the Lernean Hydra.* This monster, which had nine heads, of which the middle one was immortal, dwelt in a swamp, and ravaged the country of Lerna, near Argos. When Hercules struck its heads with his club, for each head he struck off two more appeared. With the assistance of his servant he then burned off its heads, and buried the immortal one under a huge rock. Having done this, he poisoned his arrows with the bile of the monster, thus rendering the wounds inflicted by them incurable.

(iii) *Capture of the Arcadian stag.* This animal had golden antlers and brazen feet, and Hercules was ordered to bring it alive to Eurystheus. After pursuing it in vain for a whole year, he at length wounded it with an arrow, caught it, and bore it away on his shoulders.

(iv) *Capture of the Erymanthian boar.* Hercules chased this animal through the deep snow, and at last caught it in a net and delivered it alive to Eurystheus.

(v) *Cleansing of the stables of Augeas.* Augeas, king of Elis, had a herd of three thousand oxen, whose stalls had not been cleansed for thirty years, and Hercules was ordered to cleanse them in one day. He did it by turning the rivers Alpheus and Peneus through the stalls.

(vi) *Destruction of the Stymphalian birds.* These birds had brazen claws, wings and beaks, used their feathers as arrows, and ate human flesh. They dwelt on a lake near Stymphalus, in Arcadia. Minerva provided Hercules with a brazen rattle, by the noise of which he roused the birds and then killed them with his arrows.

(vii) *Capture of the Cretan bull.* This was a mad bull that made great havoc in the island of Crete. Hercules caught it, and brought it home on his shoulders.

(viii) *Capture of the mares of Diomedes.* These mares were fed with human flesh. Hercules, with a few friends, seized them and led them to Eurystheus.

(ix) *Seizure of the girdle of the queen of the Amazons.* The daughter of Eurystheus having expressed a desire to obtain the girdle of Hippolyte, queen of the Amazons, Hercules was sent to fetch it. After an eventful journey he at length reached the country of the Amazons, and was kindly received by Hippolyte. Juno, however, excited the Amazons against him, and in the contest that ensued Hercules killed Hippolyte and carried off her girdle.

(x) *Capture of the oxen of Geryon.* Geryon was a monster with three bodies. His cattle were guarded by a giant and a two-headed dog. On his journey he erected two pillars (Calpe and Abyla) on the two sides of the Straits of Gibraltar, which were hence called the Pillars of Hercules. He slew the giant, the dog and Geryon himself, and reached home safely with the oxen.

(xi) *Bringing the golden apples of the Hesperides (hes-per'id-ēz).* These apples, which were given by Ge (the earth) to Juno at her wedding, were kept by the Hesperides and a dragon on Mount Atlas. Hercules obtained the apples, and afterwards dedicated them to Minerva, who restored them to their former place.

(xii) *Bringing Cerberus from the lower world.* This was not only the last, but the most difficult of the Twelve Labors of Hercules. Pluto, the god of the lower world, having given Hercules permission to carry off Cerberus provided he did not use force of arms, he succeeded in seizing the monster and carrying it to the upper world, taking it back again after having shown it to Eurystheus.

Having concluded his Twelve Labors, Hercules was released from the servitude of Eurystheus and returned to Thebes. Later, he became a servant to Omphale (*om'fal-ē*), queen of Lydia and widow of Tmolus, and lived with her in an effeminate manner, he wearing woman's attire, while Omphale put on his lion's skin. He afterwards married Deianira (*q.v.*), who accompanied him into exile after he had accidentally killed the boy Eunomus. Having to cross a river, Hercules went on first, leaving his wife to be carried over by the centaur Nessus. The latter attempted to do violence to her, but her screams were heard by Hercules, who shot an arrow into the heart of Nessus. Deianira preserved some of the blood of the centaur, as he told her it would enable her to keep the love of her husband. Unfortunately, however, the blood was poisoned with the arrow with which Hercules had shot Nessus, so that when Hercules put on a garment which had been steeped in the blood he speedily suffered most terrible torture, and in endeavoring to wrench the garment off, tore whole pieces of flesh from his body. Deianira, on seeing what she had unwittingly done, hanged herself. Hercules was carried off by the gods to Olympus and married Hebe.

Hermes (*her'mēz*).—See "Mercury."

Hermione (*her'mi-o-nē*).—The beautiful daughter of Menelaus and Helen. She was married, first to Neoptolemus and secondly to Orestes.

Hero (*hē'rō*).—A priestess of Venus in Sestos, beloved by Leander (*q.v.*).

Hesione (*hē'si-o-nē*).—Daughter of Laomedon, king of Troy, who was exposed by her father to the fury of a sea-monster in order to appease the anger of Apollo and Neptune. Hercules rescued her and gave her to Telamon, to whom she bore Teucer.

Hesperides (*hes-per'id-ēz*).—The guardians of the golden apples given by Ge (the Earth) to Juno at her marriage with Jupiter. They were three in number, and were the daughters of Atlas and Hesperis. See "Hercules."

Hestia.—See "Vesta."

Hippocrene (*hip-po-krē'nē*)—*i. e.* the Fountain of the Horse. A fountain near Mount Helicon, sacred to the Muses, and which is fabled to have been produced by a stroke of the hoof of the winged horse Pegasus.

Hippodamia (*hip-po-da-mī'a*).—Wife of Pirithous, at whose nuptials took place the celebrated fight between the Centaurs and Lapithæ.

Hippolyte (*hip-pol'it-ē*).—Daughter of Mars and queen of the Amazons. She was slain by Hercules (*q.v.*).

Hippolytus (*hip-pol'it-us*).—Son of Theseus and Hippolyte. In consequence of a false accusation brought against him by his stepmother Phædra, he was thrown out of his chariot and dragged along the ground till he was dead. He was restored to life by Æsculapius.

Hippomenes (*hip-pō'men-ēz*).—Son of Megarus, who conquered Atalanta (*q.v.*) in a race.

Hobomoko.—An evil spirit known among American Indians.

Hödeken.—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

Hoder.—In Norse mythology a blind god who destroyed his brother Baldur, at the instigation of Loki, without meaning to do so. He is the type of night and darkness, as Baldur is of light and day.

Hofvarpnir.—The fleet steed of Ina, in Scandinavian legend, which traveled through fire and air and enabled this messenger of the gods to see all that was happening on the earth.

Honir.—In Asgard tales, name given to the god of mind or thought.

Horæ (*ho'rē*); the Hours.—Daughters of Jupiter and Themis. They presided over the changes of the seasons, and kept watch at the gates of Olympus.

Horn of Plenty.—See "Amalthea."

Horus.—The Egyptian god of the sun, son of Osiris and Isis, who was also worshiped in Greece and at Rome.

Hugin.—One of Odin's two ravens, which carried him news from earth, and when not thus employed, perched upon his shoulders. The personification of thought or intellect.

Hugon.—A kind of evil spirit in the popular superstition of France—a sort of ogre made use of to frighten children.

Hyacinthus (*hi-a-sin'thus*).—A beautiful Spartan youth, beloved by Apollo, but accidentally killed by a blow of his quoit. From his blood sprang the flower of the same name.

Hyades (*hī'a-dēz*)—*i. e.* the Rainers. The name of seven nymphs forming a group in the head of Taurus. They were so called because when they rise simultaneously with the sun rainy weather is announced.

Hygeia (*hī-jē'i-a*).—The goddess of health, daughter of Æsculapius. She is often represented as a maiden in a long robe, and feeding a serpent from a cup.

Hylas (*hī'las*).—A beautiful youth who accompanied Hercules in the Argonautic expedition. On landing for water on the coast of Mysia, he was carried off by the Naiads.

Hymen (*hī'men*).—The god of marriage; represented as a handsome youth carrying in his hand a bridal torch.

Hymettus (*hi-met'tus*).—A mountain near Athens, famed for its honey and its marble.

Hyperborei—(*hī-per-bor'e-i*)—*lit.* "beyond the north wind." A fabulous people living in the extreme north in a land of perpetual sunshine, in a state of perfect happiness.

Hyperion (*hī-per-ī'ŏn*)—*lit.* "he who goes above." (i) A name applied to the sun. (ii) A Titan, father of the sun.

Hypsipyle (*hip-sip'i-lē*).—Daughter of Thoas, king of Lemnos, in the time of the Argonauts.

I

Iacchus (*i-ak'us*).—A name of Bacchus.

Iapetus (*i-ap'et-us*), or **Japetus.**—One of the Titans; father of Atlas, Prometheus and Epimetheus.

Icarus (*i-kar'us*).—See "Dædalus."

Ichthyophagi (*ik-thi-of'a-jī*)—*i. e.* fish-eaters.—A name given by the ancients to various peoples on the coasts of Asia and Africa.

Ida (*ī'da*).—(i) A mountain range near Troy, celebrated as the scene of the judgment of Paris (*q.v.*). From the summit of Ida the gods watched the battles in the plain of Troy. (ii) A high mountain in Crete, on which Jupiter was brought up.

Idomeneus (*ī-dom'en-ūs*).—King of Crete, and leader of the Cretans against Troy. He rashly vowed to Neptune that, if the god granted him a safe return, he would sacrifice to him whatever he should first meet on landing. He was met by his son, whom he accordingly sacrificed. A plague came in consequence, and the Cretans expelled Idomeneus.

Iduna, or **Idun.**—Daughter of the dwarf Svald, and wife of Bragi. She kept in a box the golden apples which the gods tasted as often as they wished to renew their youth. Loki on one occasion stole the box, but the gods compelled him to restore it. Iduna seems to personify that part of the year when the sun is north of the equator. Her apples indicate fruits generally. Loki carries her off to Giant-land when the sun descends below the equator, and he steals her apples. In time, Iduna makes her escape, in the form of a sparrow, when the sun again rises above the equator; and both gods and men rejoice in her return.

Iffing.—In Scandinavian mythology the great stream between the earth and the sacred lands, whose waters never froze.

Ilioneus (*ī'li-o-nūs*).—The youngest son of Niobe.

Ilium (*ī'li-um*).—A poetical name for Troy, derived from Ilus, the son of Tros, its founder. See "Troja."

Indra.—In Hindu mythology the ever-youthful god of the firmament, and the omnipotent ruler of the elements. He is a most important personage in Indian fable. In the Vedic period of the Hindu religion, he occupied a foremost rank, and, though degraded to an inferior position in the Epic, he long enjoyed a great legendary popularity. In works of art he is represented as riding on an elephant.

Ino (*ī'nō*).—Daughter of Cadmus and Hermione, wife of Athamas, king of Thebes.

Io (*ī'ō*).—Daughter of a king of Argos; beloved by Jupiter, and through fear of Juno changed into a cow (see "Argus"). Juno now tormented her with a gadfly, and drove her from land to land, swimming the Bosphorus (*i. e.* ox-ford), until she found rest at length in Egypt, where she regained her original form. She was afterwards worshiped as an Egyptian divinity under the name of Isis.

Iolaus (*ī-o-lā'us*).—The faithful companion and charioteer of Hercules.

Iphigenia (*if-i-jen-ī'a*).—Daughter of Agamemnon and Clytæmnestra, who was to have been offered up by way of expiation for an offense committed by her father against Diana in killing a hart in her sacred grove; but the goddess put a hart in her place and conveyed her to Tauris, when she became the priestess of the goddess. Here she afterwards saved her brother Orestes (*q.v.*).

Iris (*ī'ris*).—The swift-footed messenger of the gods, the personification of the rainbow. She was the sister of the Harpies.

Isis (*ī'sis*).—One of the chief Egyptian goddesses. See "Io."

Isocrates (*ī-sok'ra-tēz*).—A celebrated orator and teacher of rhetoric at Athens. He acquired a large fortune by his profession. He put an end to his life B. C. 338, aged ninety-eight.

Israfil.—Known among Arabians as the angel of music, who possessed the most melodious voice of all God's creatures. This is the angel who is to sound the resurrection trump, and make music for the saints in paradise. Israfil, Gabriel and Michael were the three angels that warned Abraham of Sodom's destruction.

Ithaca (*ith'ak-a*).—An island in the Ionian Sea, celebrated as the birthplace and the kingdom of Ulysses.

Iulus (*i-ūl'us*).—Son of Ascanius and grandson of Æneas.

Ixion (*iks-ī'on*).—King of the Lapithæ, in Thessaly, and father of Pirithous. Jupiter purified him of a treacherous murder, yet he was sufficiently ungrateful to attempt to win the love of Juno. Jupiter then hurled him into Tartarus, where he was bound fast to a perpetually revolving wheel.

J

Jamshid.—King of the genii, famous for a golden cup full of the elixir of life. This cup, hidden by the genii, was discovered while digging the foundations of Persepolis.

Janus (*jā'nus*).—An old Latin deity, the sun-god. He presided over the beginning of everything; he opened the year, and hence the first month of the year was called after him. He was the porter of heaven. His temple in the Forum had two doors opposite each other, which in time of war were open and in time of peace were shut. The latter happened only thrice in Roman history. He is represented with a face at the back, as well as one at the front, of his head.

Japetus.—See "Iapetus."

Jason (*jā'son*).—The famous leader of the Argonauts; was the son of Æson, king of Thessaly, who reigned at Iolcus. The principal part of his history is given under "Argonautæ." During his absence, while on the Argonautic expedition, his uncle Pelias had slain his father. In order to avenge this deed Medea, the wife of Jason, persuaded the daughters of Pelias to cut their father to pieces and boil him, in the belief that he would thus be restored to youth and vigor. Medea, who was well versed in magic arts, had previously changed a ram into a lamb by similar treatment. In this way, then, Pelias perished miserably, and his son Acastus expelled Jason and Medea from Iolcus. They then went to Corinth, where they lived happily for several years, until Jason deserted her in favor of Creusa, the daughter of Creon, king of Corinth. Medea took fearful vengeance. She sent Creusa a poisoned garment, which burned her to death when she put it on; the palace also took fire, and her father, Creon, perished in the flames. Medea then killed her children, and fled to Athens in a chariot drawn by winged dragons.

Jinn.—A sort of fairies in Arabian mythology, the offspring of fire. They are governed by a race of kings named Suleyman, one of whom "built the pyramids." Their chief abode is the mountain Kâf, and they appear to men under the forms of serpents, dogs, cats, monsters, or even human beings, and become invisible at pleasure. The evil jinn are ugly, but the good are beautiful. According to fable, they were created from fire two thousand years before Adam was made of earth.

Jord.—Daughter of Night and mother of Thor. In Scandinavian mythology the name given to primitive earth.

Juggernaut, or **Jaggernaut.**—A Hindu god. The temple of this god is in a town of the same name in Orissa.

Juno (*jū'no*); called Hera (*hē'ra*) by the Greeks.—The sister and wife of Jupiter, and queen of heaven; daughter of Saturn and Rhea. She was the guardian deity of women, and presided over marriage. She specially watched over the birth of children, and was then invoked under the name of Lucina (*lū-sī'na*). Homer described her as being of a jealous, obstinate and quarrelsome disposition. In consequence of the judgment of Paris (*q.v.*), she was hostile to the Trojans, and accordingly sided with the Greeks in the Trojan war. The peacock was sacred to Juno. Juno was also regarded as the guardian of the finances, and had a temple on the Capitoline hill, which contained the mint. Mars, Vulcan and Hebe were her children.

Jupiter (*jū'pit-er*); called Zeus (*zūs*) by the Greeks.—King of heaven, and greatest of the Olympian gods; was a son of Saturn and Rhea. He dwelt on Mount Olympus, in Thessaly. He was the father and supreme ruler of gods and men. His first wife was Metis (*q.v.*). By Juno, his second wife, he had two sons, Mars and Vulcan, and one daughter, Hebe. The eagle, the oak, and doves were sacred to Jupiter. He was armed with thunderbolts, and surrounded with thick clouds, the former being provided for him by the Cyclops who worked under the direction of Vulcan. Jupiter was regarded as the special protector of Rome, and had a temple on the Capitol. He was looked upon as the guardian of law and the protector of justice and virtue. He was also the ruler of the lower air, hence rain and storms were supposed to come from him. In this connection the Romans applied the surname *Pluvius* (*i. e.* the rain-bringer) to him, and special sacrifices were offered to him during long-protracted droughts.

Juventas (*jū-ven'tas*).—The Roman name for Hebe (*q.v.*), the goddess of youth.

K

Kama.—The Hindu god of love. His wife is Rati (voluptuousness), and he is represented as riding on a sparrow, holding in his hand a bow of flowers and five arrows, each tipped with the bloom of a flower supposed to conquer one of the senses. His power is so much exalted that even the god Brahma is said to succumb to it.

Kami.—The gods of ancient Japan. The name, in modern times, designates any spiritual saint, and may also be applied to a prince.

Kaswa.—The camel admitted into Moslem paradise, the favorite camel of Mohammed which fell on its knees in adoration when "the prophet" delivered the last clause of the Koran to the assembled multitude at Mecca.

Kederli.—In Mohammedan mythology is a god corresponding to the English St. George, and is still invoked by the Turks when they go to war

Kelpie.—In mythology of Scotland a spirit of the water seen in the form of a horse. Each lake has its kelpie.

Kobold.—A house-spirit in German superstition. In northern lands the name is sometimes used in place of elf or dwarf, representing an underground spirit. Probably the same as the Scotch brownie.

Koppelberg.—The hill which miraculously opened to receive the children who followed the Pied Piper. This belongs to mythology, as people in the middle ages considered Odin as the leader of disembodied spirits, and from this came the Pied Piper. The rats were the restless souls of the dead, which the Pied Piper released by drowning.

Krishna.—In Hindu mythology the eighth incarnation of Vishnu. According to some authorities, he is considered distinct from all the Avatars, as these had only a portion of the divinity, and Krishna was Vishnu himself in the form of "the Black One."

L

Ladon (*lā'don*).—The dragon that guarded the apples of the Hesperides. It was slain by Hercules.

Laertes (*lā-er'tēz*).—King of the island of Ithaca and father of Ulysses. He took part in the Calydonian boar hunt, and in the Argonautic expedition. He lived to see the return of his son to Ithaca, after the fall of Troy.

Laius (*lā'i-us*).—King of Thebes and father of Œdipus.

Laocoon (*lā-ok'o-on*).—A Trojan, priest of Apollo, who strenuously opposed the admission of the wooden horse into Troy (*q.v.*). As he was preparing to sacrifice a bull to Neptune, two fearful serpents swam out of the sea and strangled both him and his two sons.

Laodamia (*lā-od-a-mī'a*).—Daughter of Acastus and wife of Protesilaus.

Laodice (*la-od'i-sē*).—(i) Daughter of Priam and Hecuba. (ii) The name given by Homer to Electra, daughter of Agamemnon and Clytæmnestra.

Laomedon (*lā-om'e-don*).—King of Troy, father of Priam.

Lapithæ (*lap'i-thē*).—A mythical people inhabiting the mountains of Thessaly. They were ruled by Pirithous, who, as Ixion's son, was half-brother of the Centaurs. When Pirithous married Hippodamia, and invited the Centaurs to the marriage feast, the latter, fired by wine, attempted to carry off the bride and the other women. Hence arose the celebrated fight between the Centaurs and the Lapithæ, in which the former were defeated. The Lapithæ are said to have invented bits and bridles for horses.

Lares (*lār'ēz*).—Household divinities—the divinities presiding over the hearth, and the whole house. In great houses the images of the Lares were placed in a separate compartment. At meal times some portion was offered to the Lares, and on festive occasions they were adorned with wreaths.

Latinus (*la-tī'nus*).—King of Latium, who gave Æneas his daughter Lavinia in marriage.

Latmus (*lat'mus*).—A mountain in Caria, on which Endymion (*q.v.*) lay in perpetual sleep.

Latona (*la-tō'na*); called Leto (*lē'tō*) by the Greeks. The mother of Apollo and Diana, by Jupiter. She was persecuted by Juno, and wandered from place to place till she came to Delos, which was then a floating island, but which Jupiter fastened by adamantine chains to the bottom of the sea. Here Apollo and Diana were born.

Lavinia (*la-vin'i-a*).—Daughter of Latinus and wife of Æneas.

Leander (*lē-an'der*).—A young man of Abydos (*a-bī'dos*), who swam across the Hellespont every night to visit Hero, the priestess of Venus, in Sestus. One night, however, during a storm, he perished; and when his corpse was washed on the coast, on the following morning, Hero threw herself into the sea.

Leda (*lē'da*).—Wife of Tyndarus, king of Sparta. Jupiter visited her in the form of a swan, and she became the mother of Castor and Pollux, the celebrated Helen of Troy, and Clytæmnestra.

Lemnos (*lem'nos*).—One of the largest islands in the Ægean Sea; the abode of Vulcan, who was said to have fallen here when he was hurled down from Olympus. It is now called Stalimene.

Lemures.—The specters or spirits of the dead. They were said to wander about at night, as specters, and to torment and frighten the living. In order to propitiate them the Romans celebrated the festival of the *Lemuralia* or *Lemuria*.

Lerna (*ler'na*).—A forest and marsh near Argos, through which flowed a stream of the same name. Here Hercules killed the famous Lernean hydra. See "Hercules."

Lesbos (*les'bos*).—A celebrated island in the Ægean Sea, off the coast of Mysia. Its principal city was Mytilene. It was the birthplace of Sappho, Arion, Alcæus and Theophrastus.

Lethe (*lē'thē*)—*lit.* "forgetfulness" (Gr.).—A river in the lower world, the water of which was drunk by the shades, who thus obtained forgetfulness of the past.

Leto.—See "Latona."

Liber (*lī'ber*).—An old Italian deity who presided over planting and fructification. Subsequently the name was applied to Bacchus.

Libera (*lī'ber-a*).—Another name for Proserpine, daughter of Ceres, and sister of Liber.

Libitina (*lib-i-tī'na*).—The goddess of the dead, in whose temple at Rome everything pertaining to burials was sold or hired out.

Lidskialf.—The throne of Alfadir, whence he can view the whole universe.

Lif.—In Norse mythology the name given to a man who is to occupy the purified earth when goodness resumes its sway.

Lilinau.—In American Indian folk-lore Lilinau was wooed by a phantom. She followed his green waving plume through the forest, and was never seen again.

Lilith.—In Hebrew mythology a female specter who lies in wait for children in order to destroy them. The older traditions tell of Lilith as a former wife of Adam and the mother of demons. Amulets were worn as protection from her powers.

Lobairein.—In Irish mythical tales a fairy shoemaker resembling an old man, who resorts to out-of-way places where he is discovered by the noise of his hammer. He, is rich, and, while anyone keeps his eye fixed upon him, cannot escape, but the moment the eye is withdrawn he vanishes.

Lofu.—The Scandinavian god who guards friendship.

Lofua.—The Scandinavian goddess who reconciles lovers.

Loki.—The great god of fire in Norse mythology.

Lorelei.—In German legend a siren who haunted a rock of the same name on the right bank of the Rhine. She combed her hair with a golden comb, and sang a wild song which enticed fishermen and sailors to destruction on the rocks and rapids at the foot of the precipice. In northern mythology Lorelei is represented as immortal, a daughter of the Rhine, and dwelling in the river bed.

Lotis (*lō'tis*).—A nymph who, to escape from Priapus, son of Bacchus, was changed into the lotus tree.

Lotophagi (*lō-tof'a-jī*)—*i. e.* lotus-eaters.—A people visited by Ulysses during his voyage homewards from Troy. The lotus was a fruit the taste of which was so delicious that all who ate it lost all desire to return to their native land.

Lua (*lu'a*).—A goddess to whom were devoted the arms taken in battle.

Lucifer (Lat.), or **Phosphorus** (Gr.)—*i. e.* the light-bringer. The planet Venus when it appears as the morning-star.

Lucina (*lū-sī'na*).—The goddess that presides over the birth of children. It was used as a surname for Juno.

Lud.—In ancient British mythology the king of the Britons.

Luna (*lū'na*).—Goddess of the moon, called by the Greeks Selene (*sel-ē'nē*), and identified with Diana.

Lupercus (*lu-per'kus*).—A deity who protected the flocks from wolves.

Lycæus (*li-sē'us*).—A lofty mountain in Arcadia, where Jupiter and Pan were worshiped.

Lycaon (*li-kā'on*).—King of Arcadia, who impiously placed a dish of human flesh before Jupiter when the god visited him. He and all his sons were metamorphosed into wolves.

Lyceum (*li-sē'um*).—A gymnasium at Athens, outside of the city; celebrated as the place where Aristotle and the Peripatetics taught. It derived its name from the temple of Apollo Lyceus (*li-sē'us*) in the neighborhood.

Lycomedes (*li-ko-mē'dēz*).—King of Scyros, to whose court Achilles was sent, disguised as a maiden, by his mother Thetis, in order to prevent him going to the Trojan war.

Lycurgus (*li-sur'gus*).—Son of Dryas, and king of the Edones in Thrace. He prohibited the worship of Bacchus, and was hence driven mad by the gods, and subsequently killed.

Lynceus (*lin'sūs*).—One of the Argonauts, famous for the keenness of his sight.

Lyncus (*lin'sus*).—A Scythian king, who was changed by Ceres into a lynx.

M

Machaon (*ma-kā'on*).—Son of Æsculapius, a famous surgeon of the Greeks before Troy.

Maia (*mā'i-a*).—Daughter of Atlas and Pleione, and the eldest and most beautiful of the several Pleiades. She became, by Jupiter, the mother of Mercury.

Manes (*mā'nēz*)—*lit.* "the good, benevolent."—The name given by the Romans to the souls of the dead, who were worshiped as gods.

Mani.—Name given in ancient Norse mythology to the moon. Later known as the son of Mundilfori; taken to heaven by the gods to drive the moon-car. He is followed by a wolf, which, when time shall be no more, will devour both Mani and his sister Sol.

Manitou.—The great spirit of American Indians.

Marica (*ma-rī'ka*).—A Latin nymph, the mother of Latinus.

Mars (*märz*); called by the Greeks Ares (*ā'rēz*).—The god of war, of husbandry, of shepherds, and seers, who, as father of Romulus, was the progenitor of the Roman people. He was the son of Jupiter and Juno. He loved, and was beloved by Venus. The wolf and the woodpecker were sacred to Mars.

Marsyas (*mar'si-as*).—A satyr who, having found the flute which Minerva had thrown away because it distorted her features whilst playing it, rashly challenged Apollo to a musical contest. Apollo played upon the cithara and Marsyas upon the flute, and the Muses were the umpires. They decided in favor of Apollo, who then bound Marsyas to a tree and flayed him alive in accordance with the conditions of the contest —namely, that the victor should do what he pleased with the vanquished.

Medea (*mē-dē'a*).—Daughter of Æëtes, king of Colchis; celebrated for her skill in magic. She assisted Jason in obtaining the Golden Fleece (see "Argonautæ"), and accompanied him to Greece. She effectually stopped her father's pursuit by killing her brother Absyrtus (*q.v.*), and strewing his body cut in pieces on the seashore. See "Jason."

Medusa (*me-dū'sa*).—See "Gorgons."

Megæra (*me-gē'ra*).—See "Furiæ."

Megin-giord.—A magic belt worn by the god Thor. He once proposed to show his strength by lifting great weights, but when challenged to pick up the giant's cat, he tugged and strained, only to succeed in raising one paw from the floor, although he had taken the precaution to enhance his strength as much as possible by tightening his belt Megin-giord.

Meleager (*mel-e-ā'jer*).—Son of Œneus, king of Calydon; was one of the Argonauts, and also the leader of the heroes who took part in the celebrated Calydonian boar hunt. See "Calydon."

Melicerta (*mel-i-ser'ta*), or **Melicertes.**—Son of Ino and Athamas. When Athamas was seized with madness he pursued Ino and Melicertes, who in order to escape had to throw themselves into the sea, whereupon both were changed into marine deities. Ino becoming Leucothea, and Melicertes a sea-god, called by the Greeks Palaemon, and by the Romans Portunus.

Melos (*mē'los*).—An island in the Ægean Sea, and the most southwesterly of the Cyclades. It is now called Milo, and here was found the celebrated statue known as the "Venus of Milo." See "Venus."

Melpomene (*mel-pom'en-ē*).—The muse of tragedy. See "Musæ."

Memnon (*mem'nōn*).—The handsome son of Tithonus and Aurora; was king of the Ethiopians. He went to the aid of Priam, king of Troy, towards the end of the Trojan war, but was slain by Achilles. His colossal marble statue at Thebes (which, however, in reality represented the Egyptian king Amenophis) when struck by the first rays of the rising sun was said to emit a sound resembling that of a plucked string.

Menelaus (*men-e-lā'us*).—Son of Atreus, the husband of the beautiful Helen and father of Hermione; king of Lacedæmon (or Sparta), younger brother of Agamemnon. Paris (*q.v.*), having been promised the most beautiful woman in the world for his wife, sailed to Greece under the protection of Venus, and was hostably received in the palace of Menelaus at Sparta. Here he succeeded in carrying off Helen, and thus arose the Trojan war, the object of which was to recover Helen. In the Trojan war Menelaus met Paris in single combat, and would have killed him had he not been carried off in a cloud by Venus. After the death of Paris, Helen married his brother Deiphobus, who was barbarously put to death by Menelaus at the taking of Troy. Helen secretly introduced Menelaus into the chamber of Deiphobus, and thus became reconciled to him. Menelaus and Helen then sailed away from Troy, and after eight years' wandering about the shores of the Mediterranean finally reached Sparta, where they passed the rest of their lives in peace and wealth.

Mentor (*men'tor*).—The faithful friend of Ulysses.

Mephistopheles.—One of the seven chief devils in the old demonology, the second of the fallen archangels, and the most powerful of the infernal legionaries after Satan. He figures in the old legend of *Dr. Faustus* as the familiar spirit of that magician. To modern readers he is chiefly known as the cold, scoffing, relentless fiend of Goethe's *Faust*, and the attendant demon in Marlowe's *Faustus*.

Mercurius (*mer-kū'ri-us*), or **Mercury** (*mer'kū-ri*), called Hermes (*her'mēz*) by the Greeks.—Son of Jupiter and Maia; the messenger of the gods, and the god of commerce and gain. As the herald of the gods, he was the god of eloquence. He was the god of prudence and cunning, also of fraud and theft. Being the messenger of the gods, he was likewise looked upon as the god of roads who protected travelers; and was the god of music and of chemistry, hence the words *hermetic, hermetically* (sealed). He was employed by the gods to conduct departed souls to the lower world. He invented the lyre, which he first made by stretching strings across the shell of a tortoise. The palm tree, the tortoise, the number 4, and several kinds of fish were sacred to him. He is generally represented with a hat having two wings; a pair of winged sandals, which carried him with the speed of wind across land and sea; and, as messenger of the gods, he carries in his hand a wand or *caduceus* (*ka-dū'se-us*), having two serpents intertwined at one end of it.

Meriones (*mē'ri-o-nēz*).—The charioteer of Idomeneus, and one of the bravest heroes in the Trojan war.

Mermaids.—Wave maidens of northern mythology and classed with nymphs in Grecian and Roman. They were generally represented as young and beautiful virgins, partially covered with a veil or thin cloth, bearing in their hands vases of water, or shells, leaves, or grass, or having something as a symbol of their appropriate offices. They were attendants of the gods.

Meru.—In Hindu mythology a sacred mountain, eighty thousand leagues high, situated in the center of the world. It is the abode of Indra, and abounds with every charm that can be imagined. The Olympus of the Indians.

Merope (*mer'o-pē*).—Daughter of Atlas, one of the Pleiades.

Metis (*mē'tis*)—*lit.* wisdom, prudence (Gr.).—Daughter of Oceanus and Tethys, and the first wife of Jupiter. Fearing that she might give birth to a child who should become more powerful than himself, Jupiter swallowed her. Afterwards Minerva sprang from his head.

Midgard.—In Scandinavian mythology the name given to the earth. Out of the giant's flesh they fashioned Midgard (middle garden), as the earth was called, which was placed in the exact center of the vast space, and hedged all around with Ymir's eyebrows, which formed its bulwarks or ramparts. The solid portion of Midgard was surrounded by the giant's blood or sweat, which now formed the ocean, while his bones made the hills, his flat teeth the cliffs, and his curly hair the trees and all vegetation.

Midgard Sormen (earth's monster).—The great serpent that lay in the abyss at the root of the celestial ash. Child of Loki.

Milo.—The modern name for the island of Melos (*q.v.*).

Mimir.—In Scandinavian mythology the god of wisdom. Also god of the ocean, which is called "Mimir's well," in which wit and wisdom lay hidden, and of which he drank every morning from the horn Gjallar.

Minerva (*min-er'va*); called Athena (*a-thē'na*), Pallas Athene (*pal'las*), or simply Pallas, by the Greeks.—The goddess of wisdom, of the arts and sciences, of poetry and of spinning and weaving, and the protectress of agriculture. She was also a goddess of war. She was the daughter of Jupiter and Metis (*q.v.*). She was the protective deity of Athens, which was so named in honor of her (Athena): see "Athenæ." The owl, serpent, cock and olive tree were sacred to her.

Minos (*mī'nos*).—(i) Son of Jupiter and Europa, brother of Rhadamanthus, king and lawgiver in Crete, and after death one of the three judges of the shades in the infernal regions (the other two being Rhadamanthus and Æacus). (ii) Grandson of the former, likewise king of Crete, the husband of Pasiphaë and the father of Ariadne and other children. His son Androgeos (*q.v.*) having been shamefully treated by the Athenians, he made war against the latter and compelled them to send every year to Crete, as tribute, seven young men and seven maidens to be devoured by the Minotaur. This Minotaur was a terrible monster, with the head of a bull and the body of a man, the offspring of Pasiphaë and a bull. It was kept in a labyrinth constructed by Dædalus, but was slain by Theseus (*q.v.*), with the help of Ariadne, the daughter of Minos.

Minotaur (*mī'no-tawr*)—*i.e.* the bull of Minos (Lat.) —See "Minos."

Minyæ (*min'i-ē*).—The Minyans, an ancient Greek race dwelling in Thessaly. The Argonauts, being mainly Minyans, are called Minyæ.

Mithras (*mith'ras*).—The sun-god of the Persians.

Mjolnir.—From mythology of northern lands. The name of Thor's celebrated hammer—a type of the thunderbolt—which, however far it might be cast, was never lost, as it always returned to his hand; and which, whenever he wished, became so small that he could put it in his pocket.

Mnemosyne (*nē-mos'i-nē*)—*i. e.* memory (Gr.).—The mother of the Muses.

Moakkibat.—A class of angels, according to the Mohammedan mythology. Two angels of this class attend every child of Adam from the cradle to the grave. At sunset they fly up with the record of the deeds done since sunrise. Every good deed is entered ten times by the recording angel on the credit or right side of his ledger, but when an evil deed is reported the angel waits seven hours, "if happily in that time the evil-doer may repent."

Moloch.—A god of the Phœnicians to whom human victims, principally children, were sacrificed. Moloch is figurative of the influence which impels us to sacrifice that which we ought to cherish most dearly.

Momus (*mō'mus*).—The god of mockery and censure.

Mona (*mon'a*).—The isle of Anglesey; sometimes supposed to be the isle of Man. It was one of the chief seats of the Druids.

Moneta (*mon-ē'ta*).—A Roman surname of Juno as the protectress of money.

Mopsus (*mop'sus*).—The name of two soothsayers, one being the prophet of the Argonauts, and the other the son of Apollo and Manto. He contended in prophecy with Calchas (*q.v.*), whose superior he proved himself to be.

Morpheus (*mor'fe-us*).—The son of sleep and the god of dreams. The name signifies (Gr.) the fashioner, moulder, so called from the shapes he calls up before the sleeper.

Mowis.—The bridegroom of Snow, who (according to American Indian tradition) wooed and won a beautiful bride; but when morning dawned, Mowis left the wigwam, and melted into the sunshine. The bride hunted for him night and day in the forests, but never saw him more.

Musæ (*mū'zē*).—The Muses, daughters of Jupiter and Mnemosyne, were nine in number, and presided over the different kinds of poetry, the arts and sciences. Their names and special attributes were as follows: (i) Calliope (*kal-lī'o-pē*), the muse of epic poetry; (ii) Clio (*klī'ō*), of history; (iii) Erato (*er'a-tō*), of erotic poetry and mimic imitation; (iv) Euterpe (*ū-ter'pē*), of lyric poetry; (v) Melpomene (*mel-pom'-en-ē*), of tragedy; (vi) Polyhymnia (*pol-i-him'ni-a*), of the sublime hymn; (vii) Terpsichore (*terp-sik'o-rē*), of choral song and dancing; (viii) Thalia (*tha-lī'a*), of comedy; and (ix) Urania (*ū-rā'ni-a*), of astronomy. The favorite haunt of the Muses was Mount Helicon in Bœotia, where were the sacred fountains of Aganippe and Hippocrene. Mount Parnassus was also sacred to them.

Myrmidones (*mer-mid'on-ēz*), or **Myrmidons** (*mer'-mid-ons*).—A people of Thessaly, under the rule of Achilles, whom they accompanied to Troy.

Myrtilus (*mer'til-us*).—Son of Mercury, and charioteer of Œnomaus. See "Pelops."

Mysterious Three, The.—In Scandinavian mythology were Har "the Mighty," the "Like-Mighty," and the "Third Person," who sat on three thrones above the rainbow. Then came the Æsir, of which Odin was chief, who lived in Asgard (between the rainbow and earth); next came the Vanir, or gods of the ocean, air, and clouds, of which deities Niörd was chief.

N

Naiades (*nā'i-a-dēz*), or **Naiads** (*nā'yadz*).—The nymphs of freshwater. See "Nymphæ."

Naraka.—The hell of the Hindus. It has twenty-eight divisions, in some of which the victims are mangled by ravens and owls; in others they are doomed to swallow cakes boiling hot, or walk over burning sands.

Narcissus (*nar-sis'us*).—A beautiful youth, inaccessible to the feeling of love. The nymph Echo fell in love with him, but, her love not being returned, she pined away in grief (see "Echo"). In order to punish him, Nemesis made him see his own reflected image in a fountain, whereupon he became so enamored of it that he gradually pined away until changed into the flower that bears his name.

Nausicaa (*naw-sik'a-a*).—Daughter of Alcinous, who conducted Ulysses, when shipwrecked on the coast of Scheria (an island), to her father's court.

Neleus (*nē'lūs*).—Son of Neptune and the nymph Tyro; king of Pylos, in Peloponnesus, and father of Nestor (*q.v.*).

Nemea (*ne-mē'a*).—A city in Argolis, near which Hercules slew the Nemean lion.

Nemesis (*nem'e-sis*)—*i. e.* vengeance (Gr.).—The goddess of retribution, who brings down all immoderate good fortune. She was also regarded as the goddess who punished crimes. She was the daughter of Night, and was represented as a crowned virgin, of great beauty and grace, with a whip in one hand and a pair of scales in the other.

Neoptolemus (*ne-op-tol'em-us*).—Son of Achilles and Deidamia. He was also called Pyrrhus (*pir'us*), on account of his reddish hair (Gr.); his other name, Neoptolemus, which signifies *New-to-war* (Gr.), having been given to him because he *came late to Troy*. He displayed great valor at Troy, and was one of the heroes concealed in the wooden horse (see "Troy"). He slew Priam and his daughter Polyxena. At the distribution of captives Andromache, the widow of Hector, fell to his lot, and he took her to Epirus. He married Hermione, the beautiful daughter of Menelaus and Helen, but was slain by Orestes, to whom she had been previously promised.

Neptunus (*nep-tū'nus*), or **Neptune;** called Poseidon (*po-sī'don*) by the Greeks.—The god of the sea and other waters, the brother of Jupiter, and husband of Amphitrite. His palace was in the depth of the sea, near Ægæ, in Eubœa, where he kept his horses with brazen hoofs and golden manes, which drew his chariot over the waves of the sea. His celebrated contest with Minerva for the possession of Athens is narrated under "Athenæ." In the Trojan war he sided with the Greeks. He not only created the horse, but also taught men the art of managing horses by the bit and bridle. The symbol of his power was a trident, or spear with three prongs, with which he called forth or hushed storms, shook the earth, etc. Besides the trident, his attributes are the dolphin and the horse.

Nereides (*nē're-i-dēz* or *nē-rē'id-ēz*); the Nereids (*nē're-ids*).—The fifty daughters of Nereus and Doris. They were the marine nymphs of the Mediterranean (see "Nymphæ"). Thetis, the mother of Achilles, was a Nereid.

Nereus (*nē'rūs*).—Son of Pontus and Gæa, and husband of Doris, father of the fifty Nereids. He dwelt at the bottom of the sea, and was regarded as the wise old man of the sea. Like other marine divinities, he was supposed to have the power of prophesying the future, and of appearing to mortals in various shapes. The Ægean Sea was his empire—possibly the whole of the Mediterranean.

Nessus (*ness'us*).—A Centaur who was slain with a poisoned arrow by Hercules (*q.v.*).

Nestor (*nes'tor*).—Son of Neleus and king of Pylos. He was famous among the heroes before Troy for his wisdom, justice and eloquence. In early life he was a distinguished warrior, and took part in the fight between the Centaurs and the Lapithæ, and was one of the Calydonian hunters and one of the Argonauts. He is said to have lived through three generations of men. He safely reached Pylos again after the fall of Troy.

Nicneven.—A gigantic and malignant female spirit of the old popular Scottish mythology. The hag is represented as riding at the head of witches and fairies at Hallowe'en.

Nidhogg.—The dragon that gnaws at the root of Yggdrasil, the tree of the universe in Scandinavian mythology.

Niflheim.—Mist-home of old Norse mythology. The region of endless cold and everlasting night, ruled over by Hela. It consists of nine worlds, to which are consigned those who die of disease or old age. This region existed "from the beginning" in the north, and in the middle thereof was the well Hvergelmir, from which flowed twelve rivers.

Niobe (*nī'o-bē*).—Daughter of Tantalus and wife of Amphion, king of Thebes. Having seven sons and seven daughters, she imprudently boasted of her superiority to Latona, who had but two children—Apollo and Diana. The latter, indignant at her presumption, slew all her children with their arrows. Niobe herself was changed into a stone.

Niord.—The Scandinavian sea-god. He was not one of the Æsir. Niord's son was Frey (the fairy of the clouds), and his daughter was Freyja. His home was Noatun. Niord was not a sea-god like Neptune, but the spirit of water and air. The Scandinavian Neptune was Ægir, whose wife was Skadi. His temples were near the seashore and all aquatic plants belonged to him.

Nisus (*nī'sus*).—A friend of Euryalus (*ū-rī'a-lus*).—The two accompanied Æneas to Italy, and perished in a night attack on the Rutulian camp.

Nix.—Little creatures not unlike the Scotch brownie and German kobold. They wear a red cap, and are ever ready to lend a helping hand to the industrious and thrifty.

Nokomis.—Daughter of the moon, American Indian myths. Sporting one day with her maidens on a swing made of vine canes, a rival cut the swing, and Nokomis fell to earth, where she gave birth to a daughter named Wenonah.

Nornir, or **Norns.**—The three fates of Scandinavian mythology, past, present, and future. They spin the events of human life, sitting under the ash-tree Yggdrasil which they carefully tend. Their names are Urda (the past), Verdandi (the present), and Skuld (the future). Besides these three Norns, every human creature has a personal Norn or fate. The home of the Norns is called in Scandinavian mythology Doomstead.

Notus (*nō'tus*) (Gr.); called Auster by the Romans.—The south or southwest wind.

Nox (*noks*); called Nux (*nūks*) by the Greeks.—Night, daughter of Chaos.

Numitor (*nū'mi-tor*).—A king of Alba, grandfather of Romulus and Remus.

Nymphæ (*nim'fē*), or **Nymphs.**—Lesser female divinities supposed by the Greeks to dwell in the sea, springs, rivers, grottoes, trees and mountains. They had distinctive names, according to their habitat, as follows:

(i) The sea-nymphs, which were divided into two classes—the Oceanides (*ō-se-an'id-ēz*), or Nymphs of the Ocean, who were daughters of Oceanus (*ō-sē'an-us*); and the Nereides (*nē're-id-ēz* or *nē-rē'id-ēz*), or Nereids (*nē're-idz*), the nymphs of the Mediterranean, who were the daughters of Nereus.

(ii) The nymphs of fresh-water (rivers, lakes, brooks or springs); called Naiades (*nā'i-a-dēz*), or Naiads (*nā'yads*).

(iii) Oreades (*o-rē'ad-ēz*), the nymphs of mountains and grottoes.

(iv) Napææ (*na-pē'ē*), the nymphs of glens.

(v) Dryades (*drī'ad-ēz*), or Dryads, and Hamadryades (*ham-a-drī'ad-ēz*), the nymphs of trees; these nymphs died with the trees that had been their abode, and with which they had come into existence.

Nysa (*nī'sa*).—A city in India, where Bacchus was brought up.

O

Oceanus (*ō-sē'an-us*).—Son of Heaven and Earth, the god of the water that was supposed to surround the whole earth, the husband of Tethys, and the father of all the river-gods and water-nymphs of the whole earth. The ancient Greeks imagined the earth to be flat and circular, and to be surrounded by a river, which flowed perpetually around it, and which they called Oceanus. It was the great Outward Sea, opposed to the Inward or Mediterranean.

Odhærir.—In Scandinavian mythology the mead or nectar made of Kvasir's blood, kept in three jars. The second of these jars is called "Sohn," and the third "Bohn." Probably the nectar is the "spirit of poetry."

Odin.—The king of gods and men, and the reputed progenitor of the Scandinavian kings. He corresponds both to the Jupiter and the Mars of classical mythology. As god of war, he holds his court in Valhalla, surrounded by all warriors who have fallen in battle, and attended by two wolves, to whom he gives his share of food; for he himself lives on wine alone. On his shoulders he carries two ravens, Hugin (mind) and Munin (memory), whom he dispatches every day to bring him news of all that is doing throughout the world. He has three great treasures, namely, Sleipnir, an eight-footed horse of marvelous swiftness; Gungnir, a spear, which never fails to strike what it is aimed at; and Draupnir, a magic ring, which every ninth night drops eight other rings of equal value. The German tribes worshiped Odin under the name of "Woden." The fourth day of the week, Wednesday, was sacred to him.

Odur.—In Scandinavian mythology, husband of Freyja, whom he deserted. He abandoned his wife on her loss of youth and beauty, and was punished.

Odysseus (*od-is'sūs*).—The Greek form of Ulysses, king of Ithaca, whose return from Troy to Ithaca forms the subject of the Odyssey. See "Ulysses."

Œneus (*ē'nūs*).—King of Pleuron and Calydon, in Ætolia, husband of Althæa, and father of Meleager, Deianira, and other children. During his reign the boar that laid waste the lands of Calydon gave rise to the celebrated Calydonian boar hunt.

Œnone (*ē-nō'nē*).—Wife of Paris of Troy, before he carried off Helen.

Oileus (*o-ī'lūs*).—King of the Locrians, father of the lesser Ajax, and one of the Argonauts.

Olympia (*o-lim'pi-a*).—A plain in Elis, where the Olympian games were held. In the plain was the sacred grove of Jupiter, which contained the masterpiece of Greek art—the colossal statue of Jupiter by Phidias. The Olympic games were held every four years, this interval being called an Olympiad.

Olympus (*o-lim'pus*).—A mountain range on the boundary of Macedonia and Thessaly, of great height, and consequently regarded as the abode of the gods. Once the giants tried to reach heaven, and to do so piled Mount Pelion on Mount Ossa (both being high mountains in the neighborhood of Olympus); but Jupiter used his thunderbolts against them, and, with the assistance of Hercules, destroyed them all, and buried them under Mount Ætna.

Omphale (*om'fa-lē*).—A queen of Lydia, whom Hercules served as a slave a short time. She put on his lion's skin, and carried his club, whilst he donned woman's attire and spun wool.

Ops.—Wife of Saturn, the goddess of plenty and fertility, and especially the patroness of husbandry.

Oreades.—See "Nymphæ."

Orestes (*o-res'tēz*).—Son of Agamemnon and Clytæmnestra, who, on the murder of Agamemnon, after his return from Troy, by Clytæmnestra and her paramour Ægisthus, was saved from the same fate by his sister Electra. He went to Strophius, king of Phocis, who was the husband of his aunt Anaxibia. Here he formed a memorable friendship with Pylades (*pī'la-dēz*), the king's son. Later he avenged his father's death by slaying his mother and Ægisthus; but was, in consequence, seized with madness and wandered from place to place. Apollo told him he could recover from his madness only by bringing the statue of Diana from the Tauric Chersonesus. Accordingly he set out, in company with his friend Pylades; but on their arrival they would have been sacrificed by the Tauri (*q.v.*) to Diana had not Orestes' sister Iphigenia, who was the priestess of Diana, recognized him and intervened in time to save their lives. All three then escaped with the statue of the goddess. After this Orestes became king of Mycenæ, his father's kingdom, and married the beautiful Hermione, daughter of Menelaus and Helen (of Troy), after slaying Neoptolemus (*q.v.*).

Orion (*o-rī'on*).—A handsome giant and hunter. He was beloved by Diana, which so displeased Apollo that he asserted that she was unable to hit, with one of her arrows, a distant point he showed her in the sea. This point was the head of Orion, who was swimming in the sea. Thus Orion perished, and he was placed among the stars, where he appears as a giant with a girdle, sword, a lion's skin, and a club.

Orlog.—A god of Norse fable personifying the eternal law of the universe, from whose decree there was no appeal.

Ormuzd.—The name of the supreme deity of the ancient Persians, and of their descendants, the Parsees and Ghebers. He is an embodiment of the principle of good, and was created by the will of the great eternal spirit, Zervan-Akharana, simultaneously with Ahriman, the principle of evil, with whom he is in perpetual conflict. Ormuzd is the creator of the earth, sun, moon, and stars, to each of which he originally assigned its proper place, and whose various movements he continues to regulate.

Orpheus (*or'fe-us*).—A pre-Homeric poet, son of Œagrus and Calliope, lived in Thrace, and accompanied the Argonauts in their celebrated expedition. He played so skillfully on the lyre, which had been presented to him by Apollo, and which he had been taught to play by the Muses, that not only were wild beasts made tame, but even the rocks and trees moved from their places to follow him. He married the nymph Eurydice (*ū-rid'is-ē*), who died from the bite of a snake. He followed her into the lower world, where his beautiful strains of music even suspended the punishment of the wicked. Pluto promised to yield back his wife to him on the condition that he did not look back until he arrived in the upper world again. At the very moment, however, of passing the fatal bounds, Orpheus glanced back to see if she were following him, and just beheld her snatched back into the infernal regions. His grief for the loss of Eurydice was such that he treated all the Thracian women with contempt, and they in revenge, during the Bacchanalian orgies, tore him to pieces.

Ortygia (*or-tij'i-a*).—The ancient name of Delos, where Apollo and Diana were born.

Osiris (*o-sī'ris*).—A great deity of the Egyptians, husband of Isis. The ancients differ in opinion concerning this celebrated god, but they all agree that as ruler of Egypt he took care to civilize his subjects, to improve their morals, to give them good and salutary laws, and to teach them agriculture. He was worshiped under the form of an ox.

Ossa (*os'sa*).—A celebrated mountain in the northeast of Thessaly, near Mount Olympus. When the giants tried to scale heaven, they heaped Pelion, another mountain, on Ossa in order to reach the lofty mount Olympus, on the top of which Jupiter and the other gods dwelt.

P

Pæan (*pē'an*)—*lit.* "physician" (Gr.).—The name of the physician of the gods. Later the name was transferred to Apollo, and afterwards it was applied to a choral song, hymn or chant addressed to Apollo, and also to a war song before battle or after a victory.

Pagasæ (*pag'a-sē*), or **Pagasa.**—A maritime town of Thessaly, where the Argo (see "Argonautæ") was built.

Paimosaid.—In American Indian myths a walking thief, especially one who walks through cornfields about harvest time to pluck the ears of maize or corn.

Palæmon (*pal-ē'mon*).—A sea-god; originally called Melicerta (*q.v.*).

Palamedes (*pal-a-mē'dēz*).—Son of Mauplius, and one of the Greek heroes who sailed against Troy. Having exposed Ulysses (*q.v.*) when he feigned madness in order to avoid going to Troy, the latter, who was famous for his craft, revenged himself by contriving to get a letter, purporting to be written by Priam, king of Troy, concealed under Palamedes' bed. Ulysses then accused Palamedes of treachery, the fatal letter apparently established the charge, and Palamedes was stoned to death by the Greeks. Palamedes is credited with having added four letters— θ, ξ, χ, φ—to the original Greek alphabet of Cadmus, and also with the invention of quoits, dice, lighthouses, measures, scales, etc.

Pales (*pal'ēz*).—The Roman protecting deity of flocks and shepherds.

Palici (*pal-ī'sī*).—Twin sons of Jupiter and the nymph Thalia. They were worshiped in Sicily, in the neighborhood of Mount Ætna.

Palinurus (*pal-i-nū'rus*).—The pilot of Æneas, who fell into the sea off the west coast of Lucania.

Palladium (*pal-lad'i-um*).—Properly any statue of Pallas—*i. e.* Minerva; but *the* Palladium was an ancient image of the goddess at Troy, on the preservation of which the safety of the city was supposed to depend. Ulysses and Diomedes succeeded in carrying it off and afterwards took it to Greece. See "Troy."

Pallas (*pal'las*).—The Greek name of Minerva (*q.v.*).

Pan.—The chief god of shepherds and flocks; son of Mercury, and the inventor of the syrinx or shepherd's flute. He was also god of woods, in which he dwelt, and occasionally appeared suddenly before travelers, whose consequent fright was hence called "Panic fear." Pan is usually represented as a being with horns, puck-nose and goat's legs and feet.

Pandarus (*pan'da-rus*).—A celebrated archer in the Trojan army.

Pandora (*pan-dō'ra*)—*lit.* "giver of all" (Gr.).—A beautiful woman, made by Vulcan at Jupiter's command, *who received presents from the gods*—hence her name. She was the first woman on earth, and was designed to work the ruin of man in revenge for Prometheus having stolen fire from heaven and thus benefited mankind against the will of Jupiter. Venus adorned her with beauty, Mercury endowed her with boldness and cunning, and the gods, each and all, provided her with a combination of destructive powers wherewith to work out the ruin of man. Thus provided, Mercury took her to Epimetheus (*i. e.* afterthought), who made her his wife, forgetting, till *too late*, that his brother Prometheus (*i. e.* forethought) had strictly enjoined him not to receive any gifts from the gods. Pandora brought with her from heaven a box containing every human ill, which, with feminine curiosity, she opened, and out of it they all flew, to afflict mankind, Hope alone remaining.

Paphos (*paf'os*).—A town in Cyprus; the chief seat of the worship of Venus.

Parcæ (*par'sē*).—The Fates; called by the Greeks Moiræ (*moy'rē*).—They were three in number; and their names were:

(i) Clotho (*klō'tho*), the spinner of the thread of life.

(ii) Lachesis (*lak'e-sis*), the disposer of lots in life.

(iii) Atropos (*at'ro-pos*)—*lit.* "the inflexible"—the fate that cannot be avoided. To these mighty goddesses both gods and men must submit. Sometimes Atropos is represented as cutting the thread of life spun by Clotho.

Paris, usually called Alexander (*lit.* "defending men") in the *Iliad*. The second son of Priam, king of Troy, and Hecuba. He was brought up on Mount Ida by a shepherd, who gave him the name Paris. He was afterwards called Alexander on account of the bravery he displayed in defending the flocks and shepherds. He married Œnone (*ē-nō'nē*), the daughter of the river-god Cebren. He soon deserted her, however, in the following manner: At the marriage of Peleus and the Nereid Thetis all the gods, with the single exception of the goddess of Discord, were invited. Annoyed at being thus passed over, she threw among the guests a golden apple—usually called the Apple of Discord—with the inscription, "To the fairest." Three were claimants for it—Juno, Venus and Minerva. Jupiter ordered Mercury to take the three goddesses to Mount Ida, and submit the matter to the judgment of the shepherd Paris, hence giving rise to the celebrated "Judgment of Paris," which has formed the subject of so many masterpieces of art. In order to influence him in their favor severally, Juno promised him the sovereignty of Asia, Minerva renown in war, and Venus the most beautiful woman in the world for his wife. Paris decided in favor of Venus, and awarded her the golden apple. He then, under the guidance of Venus, sailed for Greece, to the court of Menelaus, king of Sparta, whose wife, Helen, was the most beautiful of women. He succeeded in carrying Helen off, and so gave rise to the famous Trojan war, as all the chiefs in Greece joined with Menelaus in an expedition to fetch her back from Troy (see "Helena"). Paris fought with Menelaus before the walls of Troy, and would have been slain by him, had not Venus interposed and carried him off in a cloud. He was killed by the celebrated archer Philoctetes, who shot him with one of the poisoned arrows of Hercules. When wounded he returned to his long-neglected wife Œnone, and requested her to heal the wound; but she refused, and he died in consequence. Œnone soon repented, however, and put an end to her own life. During the Trojan war Paris killed Achilles (*q.v.*).

Parnassus (*par-nas'sus*).—A high mountain in Phocis (Greece), with two peaks, sacred to Apollo and the Muses. Near it was the town of Delphi; and on the mountain was the famous Castalian spring, also sacred to Apollo and the Muses, in which the Pythia, the priestess, at Delphi, used to bathe.

Parthenopæus (*par'then-o-pē'us*).—Son of Meleager and Atalanta, and one of the "Seven against Thebes."

Parthenope (*par-then'o-pē*).—One of the Sirens (*q.v.*), and the name of an ancient city forming the site of the present city of Naples (Neapolis).

Pasiphae (*pā-sif'a-ē*).—Daughter of the Sun and Perseis, wife of Minos and mother of Androgeos, Ariadne and Phædra; also of the Minotaur (see "Minos").

Patroclus (*pa-trok'lus*).—The beloved friend of Achilles. Whilst Achilles remained inactive during part of the Trojan war, Patroclus was allowed by Achilles to lead the latter's Myrmidons against the Trojans at a critical time. Achilles, in order to enhance the effect, equipped him with his own armor and arms. Patroclus, whom the Trojans supposed to be Achilles himself, drove them back to the walls of Troy, where, however, he was slain by Hector. To avenge his death, Achilles quickly reappeared in the field, and slew Hector in single combat.

Pauguk.—Name given to the great power, death, in American Indian mythology.

Pau-Puk-Keewis.—In American Indian folk-lore a mischievous magician, who is pursued by Hiawatha, goes through a series of wonderful transformations in his endeavors to escape, and finally becomes an eagle.

Peboan.—In American Indian folk-lore the personification of winter in form of a great giant who shook the snow from his hair and turned water into stone by his breath.

Pegasus (*peg'a-sus*).—The winged horse which sprang from the blood of the Gorgon Medusa, when her head was struck off by Perseus (*q.v.*). It was named Pegasus from *the springs* of Ocean, near which Medusa was killed. With a blow of his hoof he caused the fountain of the Muses (Hippocrene) to spring from Mount Helicon. Bellerophon rode him when he slew the Chimæra (*ki-mē'ra*).

Peleus (*pē'lūs*).—Son of Æacus, king of the Myrmidons in Thessaly, husband of Thetis and father of Achilles. The Nereid Thetis, who was his second wife, had the power, possessed also by Proteus, of assuming any form she pleased, a power she exercised in order to escape from Peleus. But the latter, having been taught by Chiron, held the goddess fast till she promised to marry him. At their marriage all the gods, save one, were present, and the uninvited one, the goddess of strife, threw the celebrated golden apple among the guests (see "Paris"). Peleus survived the death of his famous son Achilles.

Pellas (*pe'li-as*).—King of Ioclus, in Thessaly. In order to get rid of his nephew Jason, who claimed the throne, he sent him to fetch the golden fleece, thus giving rise to the celebrated expedition of the Argonauts (see

"Argonautæ"). When Jason returned with Medea, the latter persuaded the daughters of Pelias to cut him in pieces and boil him, with the idea of thus restoring him to youth and vigor. In this way he perished. See "Jason."

Pelion (*pē'li-on*).—A lofty range of well-wooded mountains in Thessaly. The giants heaped it on Mount Ossa, in their attempt to scale heaven (see "Ossa" and "Olympus"). The Centaur Chiron dwelt in a cave near its summit. The Argo (see "Argonautæ") was built from timber felled here.

Pelops (*pē'lops*).—Son of Tantalus, king of Phrygia, father of Atreus and Thyestes, grandfather of Agamemnon and Menelaus. When a boy he was cut in pieces and boiled to make a savory dish to set before the gods, whom Tantalus, the favorite of the gods, had invited to a repast; but the gods would not touch it, and ordered Mercury to again put him into a caldron, whereby he was restored to life. Being driven out of Phrygia, he went to Elis, a province of Peloponnesus, and there obtained the hand of Hippodamia, daughter of King Œnomaus, whom he succeeded on the throne. He afterwards became so powerful that the whole peninsula was called after him "the island of Pelops." In order to gain Hippodamia (*hip-po-da-mī'a*) he had first to engage in a chariot race with Œnomaus (*ē-nom'a-us*), a condition which the latter imposed on every suitor for his daughter's hand, as an oracle had declared that he would be killed by his son-in-law. His horses being swifter than those of any mortal, many a suitor had suffered death, the stipulated penalty of defeat. Pelops, however, bribed Myrtilus, the charioteer of Œnomaus, to remove the linchpins of his master's chariot, the bribe being the promise of half the kingdom. In the race the wheels of Œnomaus' chariot soon came off, and Œnomaus was thrown out, and killed. Pelops thus gained Hippodamia, but was unwilling to keep faith with Myrtilus, whom he threw from a cliff into the sea.

Penates (*pē-nā'tēz*).—Old Latin guardian deities both of a household and of the state. The images of these gods were kept in the penetralia (*pen-e-trā'li-a*)—that is, the *innermost* or central part of the house. The Lares (*q.v.*) formed part of the Penates. On the hearth a perpetual fire was kept up in their honor, and the table, which was also sacred to them, always contained the salt-cellar and offerings of first fruits for them.

Penelope (*pe-nel'o-pē*).—The wife of Ulysses; celebrated for her constancy to her husband during his twenty years' absence from Ithaca. She was the daughter of Icarius and Peribœa, of Sparta, and was won by Ulysses in the following way: Her father promised her to the suitor who should win a foot-race; but when Ulysses was the successful competitor her father tried to persuade her not to leave him. Ulysses left her free to act as she pleased in the matter, whereupon she covered her face with her veil to hide her blushes, and thus intimated that she preferred to accompany him as her husband. By Ulysses she became the mother of an only child, Telemachus. During Ulysses' long absense she was the object of much undesired attention on the part of a host of importunate suitors, who declared that Ulysses must surely be dead. Penelope at last promised to make a selection of one of their number to be her husband as soon as she had finished a robe she was making for Ulysses' aged father, Laërtes (*lā-er'tēz*). This was only a ruse (generally referred to as "Penelope's web"), however, to put them off, as she undid every night the work done during the day. At last the secret was betrayed by one of her servants, and she was importuned more than ever. Ulysses now arrived home after twenty years' absence at Troy and his subsequent celebrated wanderings, and came at first disguised as a beggar to see how the land lay. Having soon ascertained his wife's noble fidelity, he still further tested her by getting her to promise her hand to the suitor who could draw his bow. This none of them could do, so Ulysses took it up and slew them all. He then made himself known to Penelope, and went to see his aged father.

Peneus (*pē-nē'us*).—The principal river of Thessaly, which flows in the valley of Tempe, between Mount Pelion and Mount Ossa, into the sea; also the river-god, who was the father of Daphne and Cyrene.

Penthesilea (*pen-thes-i-lē'a*).—The young and beautiful queen of the Amazons, who fought against the Greeks before Troy, and was slain by Achilles.

Pentheus (*pen'thūs*).—Grandson of Cadmus, whom he succeeded as king of Thebes. He was opposed to the introduction of the worship of Bacchus into his kingdom, and in consequence was torn to pieces by his mother and her sisters, who in their Bacchic frenzy imagined him to be a wild beast.

Perdix (*per'diks*).—The nephew of Dædalus (*q.v.*), the inventor of the chisel, saw, compasses, etc.

Peri.—Peris are delicate, gentle, fairy-like beings of eastern mythology, begotten by fallen spirits. They direct with a wand the pure in mind the way to heaven. These lovely creatures, according to the Koran, are under the sovereignty of Eblis; and Mohammed was sent for their conversion, as well as for that of man.

Persephone (*per-sef'on-ē*).—The Greek name for Proserpina (*q.v.*).

Perseus (*per'sūs*).—Son of Jupiter and Danaë (*q.v.*). His most heroic deed was the slaying of the Gorgon Medusa, which he accomplished in the following manner: With the aid of Mercury and Minerva he possessed himself of the winged sandals, the magic wallet, and the helmet of Pluto, which rendered the wearer invisible, and further received from Mercury a sickle, and from Minerva a mirror. Thus provided, he rose into the air and made his way to the abode of the Gorgons. He found them asleep, and cut off with the sickle the head of Medusa, looking at her terrible form in the mirror, as a single glance would have immediately changed him into stone. Perseus placed her head in the magic wallet, which he carried on his back, and escaped in safety from the pursuit of the two other Gorgons, the helmet rendering him invisible. He then proceeded to Æthiopia, where he slew the sea-monster, and saved and married the beautiful Andromeda (*q.v.*). The latter having been previously promised, however, to her uncle Phineus, he and several armed companions made their appearance at the nuptials, and endeavored to carry off the bride; but Perseus brought out Medusa's head, and they were all turned into stone. Perseus afterwards gave the head of Medusa to Minerva, who placed it in the middle of her breastplate or shield. In fulfillment of the oracle he accidentally killed his grandfather Acrisius (*q.v.*) with a quoit. He is said to have founded Mycenæ.

Phæaces (*fē-ā'sēz*).—A fabulous people represented in the *Odyssey* as inhabiting the island of Scheria (afterwards Corcyra; now Corfu), and famous as sailors. Alcinous (*q.v.*) was their king.

Phaethon (*fā'e-thon*)—*lit.* "the shining" (Gr.).—Son of the sungod (Apollo) and Clymene (*klī'men-ē*). Having obtained permission from his father to drive the chariot of the sun across the heavens for one day, he drove so near the earth that he almost set it on fire, his strength being insufficient to keep the horses in the right track. Consequently Jupiter hurled him down with a thunderbolt into the river Padus (Po).

Phaon (*fā'ōn*).—A boatman at Mytilene, who, originally an ugly old man, was made young and handsome by Venus, whom he had carried across the sea without payment. Sappho (*q.v.*) thus fell in love with him, and, on her love not being returned, threw herself into the sea.

Philoctetes (*fil-ok-tē'tēz*).—A very famous archer, a friend of Hercules, who gave him at his death the poisoned arrows without which Troy could not be taken. In the tenth year of the Trojan war he was specially fetched from Lemnos, where he had been detained by a wound, by Ulysses and Diomedes. On arriving at Troy, Æsculapius or his sons cured his wound. He slew Paris and other Trojans.

Phlegethon (*fleg'e-thon*)—*lit.* "the blazing" (Gr.).—A river in the lower world, which ran with fire instead of water.

Phœbe (*fē'bē*).—A feminine form of Phœbus (*lit.* "the bright one"); applied to Diana, the sister of Apollo, as the goddess of the moon.

Phœbus (*fē'bus*)—*lit.* "the bright one" (Gr.).—An epithet applied to Apollo as the god of the sun. See "Apollo."

Phœnix (*fē'nix*).—(i) A fabulous bird described as being as large as an eagle; its head finely crested with a beautiful plumage, its neck covered with gold-colored feathers, its tail white, and its body purple or crimson. (ii) Son of Amyntor, the teacher of Achilles, and his companion during the Trojan war.

Phorcys (*for'sis*), or **Phorcus** (*for'kus*).—A sea-god, father of the Gorgons and of the Grææ.

Phrixus (*frix'us*).—Son of Athamas and Nephele. Athamas having neglected Nephele (*nef'el-ē*), and married Ino, the latter persuaded him to sacrifice Nephele's son Phrixus to Jupiter. Nephele, however, enabled her two children, Phrixus and Helle, to escape by means of a ram with golden fleece, the gift of Mercury, which carried them through the air. Helle fell into the sea (see "Helle"), but Phrixus arrived safely in Colchis, the kingdom of Æëtes (*q.v.*). Here he sacrificed the ram to Jupiter, and gave its golden fleece to Æëtes, who suspended it to an oak tree in the grove of Mars. To fetch this golden fleece the famous expedition of the Argonauts (see "Argonautæ") was undertaken.

Picus (*pī'kus*).—Son of Saturn and father of Faunus. He was changed by Circe into a woodpecker, because he did not requite her love. The Romans regarded the woodpecker as a prophetic bird, sacred to Mars.

Pieria (*pī-er'i-a*).—A district of Macedonia, in the north of Greece; celebrated as one of the earliest seats of the worship of the Muses, who are hence called Pierides (*pī-er'id-ēz*). Hence the following lines:—

"A little learning is a dangerous thing;
Drink deep, or taste not the Pierian spring."
Pope's *Essay on Criticism.*

Pirene (*pī-rē'nē*).—A noted fountain at Corinth, at which Bellerophon caught Pegasus.

Pirithous (*pī-rith'o-us*).—Son of Ixion, whom he succeeded as king of the Lapithæ; famous for his friendship with Theseus. When Pirithous was invading Attica he was opposed by Theseus, king of Athens, for whom he soon conceived feelings of admiration, which afterwards deepened into a lasting friendship. At the marriage of Pirithous with Hippodamia (*hip-po-da-mī'a*) the bride was seized by a drunken Centaur, and thus arose the celebrated fight between the Centaurs and Lapithæ (*q.v.*), in which, with the assistance of Theseus, Pirithous and the Lapithæ came off victorious. On the death of Hippodamia, Pirithous conceived the bold project of carrying off Proserpine, wife of Pluto. Accordingly the two friends descended into the lower world, but were seized by Pluto and chained to a rock, where they both remained till Hercules visited that region. Hercules then delivered Theseus, who was suffering punishment merely on account of his friendship for Pirithous; but the latter he left to his fate.

Pleiades (*plē'ya-dēz*).—The seven daughters of Atlas and Pleione (*plē'yo-nē*).—They were the virgin companions of Diana, and when pursued by Orion were changed into doves and placed among the stars.

Pluto (*plū'tō*).—The god of the nether world; originally called Hades (*hā'dēz*), the name Pluto (*lit.* "wealth") being applied to him because corn, the *wealth* of early times, was sent from beneath the earth as his gift. He was the son of Saturn and Rhea, brother of Jupiter and Neptune, and the husband of Proserpine. He possessed a celebrated helmet, which rendered the wearer invisible, and which Perseus (*q.v.*) borrowed when he went to slay the Gorgon Medusa. Black sheep were sacrificed to him. Pluto was also called Dis (*dis*) and Orcus (*or'-kus*).

Plutus (*plū'tus*).—The god of wealth; represented as blind.

Pluvius (*plū'vi-us*)—*lit.* "rain-bringing" (Lat.).—A surname of Jupiter, to whom sacrifices were offered in times of drought. See "Jupiter."

Pollux.—See "Castor."

Polyhymnia.—See "Muse."

Polyphemus (*pol-i-fē'mus*).—Son of Neptune; was one of the celebrated Cyclops living in Sicily. He was a huge monster, having but one eye in the center of his forehead, and ate human flesh. Being rejected by the nymph Galatea in favor of Acis, he crushed the latter under an enormous rock. Ulysses, during his wanderings on his journey homeward after the fall of Troy, was driven upon Sicily, and at once seized by Polyphemus, who shut him and his companions in the great cave in which he dwelt. In the evening he drove his flock into the cave, closed the mouth of the cave with a heavy rock, and ate two of Ulysses' companions for his supper. The next morning he led his sheep out to pasture, closing the mouth of the cave after him. The wily Ulysses then contrived and successfully carried out the following plan of escape: When the monster returned in the evening, Ulysses offered him some wine he had brought with him, and gave him enough to make him intoxicated. Polyphemus asked Ulysses his name, and the latter gave that of Noman. The giant then fell asleep, whereupon Ulysses and his companions, having made everything ready, bored out his eye with a red-hot piece of timber. Polyphemus roared out, and the other Cyclops dwelling on the island came to the mouth of the cave and inquired what was the matter; Polyphemus replied that *no man* had injured him, whereupon they all went away. Even now, however, Ulysses could not escape, the cave being closed by such a heavy rock, and had to wait till the following morning. Polyphemus then removed the rock, but sat by the opening and felt the back of each sheep as it passed out. Ulysses, whose name is synonymous with craft itself, had foreseen this, however, and he and his six companions safely passed out by clinging to the wool on the bellies of the sheep. They then made their way to their ships, and quickly put out from the shore. When a little way out Ulysses derided Polyphemus, whereupon the latter threw several immense rocks after him, one of which nearly struck his ship. See *Odyssey*, Book IX.

Polyxena (*pol-ix'en-a*).—Daughter of Priam and Hecuba. She was beloved by Achilles, and sacrificed at the grave of the latter by his son Pyrrhus.

Pomona (*pō-mō'na*).—The goddess of fruit and fruit trees. Her name is derived from Lat. pomum, fruit (of any kind).

Ponemah.—In American Indian mythology the name of the land of the future life, or the spirit land.

Portunus (*por-tū'nus*), or **Portumnus** (*por-tum'nus*).—The protecting god of harbors.

Poseidon (*po-sī'don*).—See "Neptune."

Priam (*prī'am*).—Son of Laomedon, the famous king of Troy at the time of the Trojan war. The name Priam (Gr.) means the Chief, or Leader. He was the husband of Hecuba, and the father of Paris, Hector, Deiphobus, Cassandra, Polyxena, etc. On the capture of Troy he was slain by Pyrrhus, the son of Achilles.

Priapus (*pri-ā'pus*).—Son of Bacchus and Venus. The god of fruitfulness in general, and the protector of flocks of sheep and goats, of bees, of the vine, and of all garden produce.

Procas (*prō'kas*).—King of Alba Longa, and father of Numitor and Amulius.

Procne (*prok'nē*).—Sister of Philomela (*q.v.*).

Procris (*prō'kris*).—Wife of Cephalus (*q.v.*).

Procrustes (*prō-krus'tēz*)—*lit.* "the Stretcher" (Gr.).—The name of a famous robber of Greece, who used to make all his captives fit into his iron bed, either by cutting pieces off their legs if they were too long, or by stretching them out if they were too short. He was slain by Theseus.

Prometheus (*pro-mē'thūs*)—*lit.* "Foret hought" (Gr.).—Son of the Titan Iapetos, brother of Epimetheus (*ep-i-mē'thūs*), or "After-thought." The great benefactor of mankind, in spite of Jupiter. He stole fire from Olympus (heaven), and was the inventor of many arts, especially of working in metal and clay, whence he is said to have made man from clay. As a set-off against these advantages, Jupiter gave Pandora (*q.v.*) to Epimetheus. He also chained Prometheus to a rock, where in the daytime an eagle consumed his liver, which grew again during each succeeding night. From this perpetual torture he was delivered by Hercules, who killed the eagle.

Proserpina (*pro-ser'pin-a*); usually called **Proserpine** (*pros'er-pīn*); called by the Greeks Persephone (*per-sef'on-ē*).—Daughter of Jupiter and Ceres, and queen of the lower world. Her father, unknown to her mother, promised her to Pluto, who carried her off by causing the earth to open beneath her as she was gathering flowers. In consequence of this, Ceres did not allow the earth to bring forth any fruits, and Jupiter was obliged to send Mercury into the lower world to fetch Proserpine back. Pluto allowed her to go, but first gave her a pomegranate to eat. Having thus eaten in the lower world, she was obliged to spend one-third of the year with Pluto, remaining during the other two-thirds with her mother (see "Ceres"). Pluto and Proserpine ruled over the souls of the dead in the lower world.

Proteus (*prō'tūs*).—A sea-god who had the power of assuming any form he pleased. He tended the flocks (seals) of Neptune, and at midday rose from the sea and slept in the shade of the rocks. At such times he was much sought after, his prophetic powers being highly valued. When seized by the person wishing to consult him, he, in order to escape, assumed several different shapes in succession; but, if firmly held, he speedily returned to his original form, and prophesied.

Psyche (*sī'kē*)—*lit.* "the soul" (Gr.)—The following beautiful story shows in an allegorical manner how the human soul is purified by misfortunes and prepared for the enjoyment of true and lasting happiness hereafter: Psyche was the youngest and most beautiful of the three daughters of a king, and by her beauty excited the jealousy of Venus. The goddess consequently ordered Cupid to inspire her with love for some utterly unworthy object; but instead of doing this Cupid himself fell in love with her. He accordingly visited her every night, leaving her always at daybreak. Her jealous sisters, however, made her believe that her midnight lover was a monster, and accordingly she one night brought a lamp while Cupid was asleep, and was astonished to behold the lovely god. In her excitement she let fall a drop of hot oil on the shoulder of Cupid, and so awoke him. He blamed her for her mistrust, and fled. In misery Psyche now wandered from temple to temple, inquiring after her lover, and at length came to the palace of Venus. Here she was treated with great severity and compelled to perform hard and menial tasks, which would have overcome her had not Cupid secretly and invisibly sustained her. At length she overcame the jealousy

of Venus, and, becoming immortal, was united to Cupid forever. In works of art Psyche is represented as a maiden with the wings of a butterfly.

Pukwana.—The smoke from the calumet or peace pipe among American Indians. The pipe was made from stone found near the headwaters of the Mississippi. A quarry, located near the mountains, was famous among the Indians, who had made the adjacent territory neutral ground. Here they came and provided themselves with pipes. To apply the stone to any other use than that of pipe-making would have been sacrilege in their mind. From the color, they even fancied it to have been made, at the great deluge, out of the flesh of the perishing Indian.

Puk-Wudjies.—The pygmies of American Indian folklore; little wild men of the woods.

Pygmalion (*pig-mā'li-on*).—King of Cyprus, who became enamored of an ivory statue which he had made. Venus having answered his prayer to her to breathe life into it, he married the maiden.

Pylades (*pil'a-dēz*).—Nephew of Agamemnon, and celebrated as the friend of Orestes (*q.v.*). He married Electra, the sister of Orestes.

Pyramus (*pir'a-mus*).—The lover of Thisbe (*q.v.*).

Pyrrhus (*pir'us*).—See "Neoptolemus."

Python (*pī'thon*).—The famous serpent produced from the mud left after the subsidence of the deluge of Deucalion. It was slain near Delphi by Apollo, who founded the Pythian games to commemorate the victory.

Q

Quirinus (*kwi-rī'nus*).—The name of Romulus after his deification.

R

Rachaders.—In Indian mythology the second tribe of giants or evil genii, who had frequently made the earth subject to their kings, but were ultimately punished by Siva and Vishnu.

Radegaste.—In Slavonic mythology a tutelary god of the Slavi. The head was that of a cow, the breast was covered with an ægis, the left hand held a spear, and a cock surmounted its helmet.

Ragnarök (twilight of the gods).—The day of doom, when the present world and all its inhabitants will be annihilated. Vidar and Vali will survive the conflagration, and reconstruct the universe. In Scandinavian mythology the belief is taught that after this time the earth or realm will become imperishable and happiness sure.

Rahu.—In Hindu mythology the demon that causes eclipses. One day Rahu stole into Valhalla to quaff some of the nectar of immortality. He was discovered by the Sun and Moon, who informed against him, and Vishnu cut off his head. As he had already taken some of the nectar into his mouth, the head was immortal; and he ever afterward hunted the Sun and Moon, which he caught occasionally, causing eclipses.

Rakshas.—Evil spirits in Hindu myths, who guard the treasure of Kuvera, the god of riches. They haunt cemeteries and devour human beings; assume any shape at will, and their strength increases as the day declines. Some are hideously ugly, but others, especially the female spirits, allure by their beauty.

Ravana.—According to Indian mythology, was fastened down between heaven and earth for ten thousand years by Siva's leg, for attempting to move the hill of heaven to Ceylon. He is described as a demon giant with ten faces.

Ravens.—According to an oracle from the gods, delivered at ancient Athens, ravens prognosticate famine and death because they bear the characteristics of Saturn, the author of these calamities, and have a very early perception of the malign influence of that planet.

Remus (*rē'mus*).—The brother of Romulus (*q.v.*).

Rhadamanthus (*rad-a-man'thus*).—Son of Jupiter and Europa, and brother of Minos. He was one of the three judges in the lower world, the other two being Æacus and Minos.

Rhea (*rē'a*).—See "Cybele."

Rhea Silvia (*rē'a sil'vi-a*).—Daughter of Numitor, and mother of Romulus and Remus.

Rhesus (*rē'sus*).—A Thracian prince, who went to the assistance of Troy. As an oracle had declared that Troy would never be taken if the snow-white horses of Rhesus once drank of the Xanthus and fed on the grass of the Trojan plain. Diomedes and Ulysses slew Rhesus on the night of his arrival on Trojan territory, and carried off his horses.

Rhodope (*rod'o-pē*).—A lofty mountain range in Thrace, which, like the rest of Thrace, was sacred to Bacchus.

Romulus (*rom'u-lus*).—The founder and first king of Rome; twin-brother of Remus, son of Silvia by Mars. Silvia was the daughter of Numitor and a vestal virgin, hence the twins were condemned to be thrown into the Tiber. This was done; but the cradle stranded, and they were suckled by a she-wolf. They were afterwards found by Faustulus, the shepherd of king Amulius, who handed them over to the care of his wife Acca Larentia. When grown up, they decided to found a city on the Tiber; but in a dispute as to the site, Romulus killed Remus. When the city was built, it was found that women were very scarce. Romulus accordingly proclaimed that games were to be celebrated, and invited his neighbors, the Latins and Sabines, to the festival, during which the Roman youths carried off the maidens—this being generally referred to as "The Rape of the Sabine Women." Hence arose a war between the two peoples, which was brought to a termination by the Sabine women rushing in between the armies and praying them to be reconciled. After a reign of thirty-seven years, Romulus was taken up to heaven by his father Mars in a fiery chariot. He was then worshiped by the Romans as Quirinus (*kwi-rī'nus*).

S

Saga.—Goddess of history in Scandinavian mythology.

Salamander.—A fabulous animal supposed by the ancients to live in and have the quality of eating fire.

Salmoneus (*sal-mō'nūs*).—Son of Æolus and brother of Sisyphus. He presumed to imitate the thunder and lightning of Jupiter, and was consequently hurled down to Tartarus with a thunderbolt by the father of the gods.

Sarpedon (*sar-pē'don*).—(i) Son of Jupiter and Europa, king of the Lycians. Jupiter granted him the privilege of living three generations. (ii) Grandson of the preceding; assisted the Trojans in the Trojan war, but was slain by Patroclus.

Saturnus (*sā-tur'nus*); usually called **Saturn** (*sat'urn*); called by the Greeks Cronos.—A mythical king of Italy, whose reign was the "golden age." He was the son of Uranus (Heaven) and Gæa (Earth), the husband of Rhea, and the father of Jupiter, Juno, Pluto, Neptune, etc. He was the god of agriculture and of civilization in general. He was dethroned from the government of the world by his son Jupiter. His temple in Rome was used as the state treasury.

Satyri (*sat'er-ī*), or **Satyrs** (*sat'erz*).—A kind of wood-deities, resembling apes, with two goats-feet, and very lascivious. The older Satyrs were generally called Sileni (*sī-lē'nī*), and the younger ones Satyrisci. They were described as fond of wine, sleep, and music.

Scamander (*ska-man'der*).—A celebrated river near Troy.

Scamandrius (*ska-man'dri-us*), or **Scamander.**—Son of Hector and Andromache (*an-drom'a-kē*), whom the Trojans called Astyanax (*q.v.*).

Sciron (*sī'ron*).—A famous robber of Attica, slain by Theseus. He compelled those he robbed to wash his feet on the Scironian rock (which was named after him), and at the completion of the process kicked them over the rock into the sea. At the base of the rock was a tortoise, which devoured them.

Scylla (*sill'a*), and **Charybdis** (*ka-rib'dis*).—The names of two rocks, opposite to one another, between Italy and Sicily. In the one nearest to Italy was a cave in which dwelt Scylla, who was a terrible creature (female) with six long necks and heads, each of which contained three rows of sharp teeth, twelve feet, and barking like a dog. On the opposite rock, Charybdis, dwelt a being of the same name under an immense fig tree. Thrice a day she swallowed the waters of the sea and thrice threw them up again. Between these rocks, Scylla and Charybdis, the sea was very narrow and very dangerous. Hence mariners had to exercise great vigilance lest while avoiding Scylla they did not fall on Charybdis. This last expression is often used in speaking of cases where a middle course has to be carefully steered between two threatening difficulties.

Scyros (*sī'ros*).—An island in the Ægean Sea, near Eubœa. Here Achilles—at the court of King Lycomedes—was concealed, dressed as a woman, by his mother Thetis, in order to prevent his going to the Trojan war.

Sedrat.—The lotus tree which stands on the right hand side of the invisible throne of Allah. Its branches extend wider than the distance between heaven and earth. Its leaves resemble the ears of an elephant. Each seed of its fruit incloses an houri; and two rivers issue from its roots. Numberless birds sing among its branches, and numberless angels rest beneath its shade.

"DRINK THIS, PSYCHE, AND BE IMMORTAL"

THE MARRIAGE OF CUPID AND PSYCHE

This symbolical picture represents the conscious union of the Soul of Man, figured as a young girl (Psyche), with the divine Spirit of Love (Cupid). Their starry or celestial environment signifies the emergence of the soul from matter into a permanent, uninterrupted or eternal life. The beautiful Greek story as a whole is simply an allegory describing the fall of the soul of man into earthly conditions; the labors and pains there undergone in order that, refined and redeemed, it may once more be raised into the heavenly world.

Semele (*sem'el-ē*).—Daughter of Cadmus and Harmonia, and mother, by Jupiter, of Bacchus. Juno, actuated by jealousy, persuaded her to ask Jupiter to appear before her in his terrible majesty as king of heaven. Having promised to grant whatever she desired, Jupiter did so; but warned her of the danger she would incur. The result was that she was consumed by the lightning; but Jupiter saved her child Bacchus.

Serapis (*se-rā'pis*).—An Egyptian divinity (male), whose worship was introduced into Rome, together with that of Isis, toward the end of the republic.

Seven Sages.—Same as *Seven Wise Men of Greece* (*q.v.*).

Seven Wise Men of Greece.—The title applied to seven Greeks of the sixth century B. C., who were distinguished for their practical wisdom and their terse maxims or principles of life. Their names are as follows: Bias, Chilo, Cleobulus, Periander (in place of whom some give Epimenides), Pittacus, Solon and Thales. They were the authors of the following famous mottoes, inscribed in later times in the temple of Apollo at Delphi: "Most men are bad," *Bias;* "Consider the end," *Chilo;* "Avoid excess," *Cleobulus;* "Nothing is impossible to industry," *Periander;* "Know thy opportunity," *Pittacus;* "Know thyself," *Solon;* "Suretyship is the precursor of ruin," *Thales.*

Seven Wonders of the World.—A name applied to seven very remarkable objects of the ancient world. They are usually given as follows:

(i) The Pyramids of Egypt.

(ii) The Pharos (*fā'ros*) of Alexandria, which was a lofty lighthouse built by Ptolemy II. on the island of the same name, just opposite to Alexandria and united to it by a mole.

(iii) The walls and hanging gardens of Babylon. The walls are described under "Ninus." The hanging gardens of Nebuchadnezzar were laid out upon terraces, which were raised one above another on arches.

(iv) The Temple of Diana at Ephesus.

(v) The colossal statue of the Olympian Jupiter by Phidias. It was made of ivory and gold, and the god was represented as seated on a throne of cedar wood, adorned with gold, ivory, ebony and precious stones.

(vi) The mausoleum of Artemisia.

(vii) The Colossus of Rhodes.

Sibyllæ (*si-bil'lē*), or **Sibyls.**—Prophetesses, supposed to be ten in number. The most famous of them is the Cumæan, who was consulted by Æneas before he descended into the lower world and gave him the sop to throw to Cerberus, which, when he had devoured it, threw him into a deep sleep and so enabled Æneas to slip by.

Sichæus (*si-kē'us*).—Dido's uncle and husband; often called Acerbas. He was murdered by Pygmalion, Dido's brother.

Silenus (*si-lē'nus*).—A name specially applied to a satyr (*q.v.*) who brought up and instructed Bacchus and was his constant companion. He is described as a bald-headed, jovial old man, generally intoxicated, and hence unable to trust his own legs to carry him safely. He generally rode on an ass. He possessed prophetic powers, which he could be made to exercise by surrounding him with chains of flowers while he was drunk and asleep.

Silvanus (*sil-vā'nus*).—A Latin deity presiding over woods and forests.

Sinon (*sin'on*).—Son of Æsimus, who allowed the Trojans to take him prisoner, and then persuaded them to take the famous wooden horse into their city. See "Troy."

Sirenes (*sī-rē'nēz*), or **Sirens** (*sī'renz*).—Sea nymphs, three in number, who had the power of enticing mariners to their destruction on dangerous rocks by their sweet music. In order to get his ship away in safety from them, Ulysses stuffed the ears of his companions with wax and then tied himself to the mast of the vessel, and did not release himself till he could no longer hear their charming voices. They dwelt on an island near the southwest coast of Italy.

Sisyphus (*sis'i-fus*).—Son of Æolus and king of Corinth; notorious for his avarice and deceit. His punishment in the lower world was to roll to the top of a hill a huge marble block, which no sooner reached the top than it rolled down again: hence a never-ending punishment.

Siva.—The third of the Hindu triad of divinities, who, among a thousand names, bears also that of Mahadeva. The greatest confusion exists as to his attributes; now he is said to be the destroyer, and now the creative principle.

Somnus (*som'nus*).—The god of sleep; was a son of Night and a brother of Death.

Soracte (*sō-rak'tē*).—A high mountain, near the Tiber, in Etruria, on the summit of which was a temple of Apollo.

Specter of the Brocken.—Among German myths, a singular colossal apparition seen in the clouds, at certain times of the day, by those who ascend the Brocken, or Blocksberg, the highest peak of the Hartz mountains.

Sphinx (*sfingks*).—A she-monster, who proposed a riddle to the Thebans, and murdered all who failed to guess it (see "Œdipus"). In works of art she is represented with a woman's bust on the body of a lioness. The word Sphinx (Gr.) means *the Throttler*, from her manner of killing her victims.

Stentor (*sten'tor*).—A Grecian herald in the Trojan war. His voice was as loud as that of fifty ordinary men together: hence our word *stentorian*.

Stheno.—See "Gorgons."

Stymphalus (*stim-fā'lus*).—A town in Arcadia; the haunt of the terrible birds slain by Hercules. See "Hercules (vi)."

Styx (*stiks*)—*i. e.*, "the hateful, horrible" (Gr.).—The principal river of the lower world, around which it flows seven times. Charon (*q.v.*) ferried the souls of the departed across it. By the Styx the gods swore their most sacred oaths.

Surya.—The sun-god, according to the Hindu *Veda*, whose car is drawn by seven green horses, the charioteer being Dawn.

Sybaris (*sib'ar-is*).—A Greek town in Lucania, notorious for the luxury of its inhabitants: hence our word *Sybarite*.

Syphax (*sif'ax*).—King of one of the tribes of the Numidians. See "Sophonisba."

Syrinx (*sī'rinks*).—A nymph, who, being pursued by Pan, was metamorphosed into a reed, of which Pan then made his shepherd's pipe, usually called Pan's pipe.

T

Tantalus (*tan'ta-lus*).—Son of Jupiter and the nymph Pluto; father of Pelops and Niobe. Having divulged some of his father's secrets, he received a terrible punishment in the lower world. He was made to stand up to his chin in water, being at the same time afflicted with a raging thirst, and over his head hung branches of tempting fruit, yet when he attempted to drink the waters receded from him, and when he would pluck the fruit the branches immediately sprang out of his reach. Moreover, a huge rock was suspended above his head, threatening every moment to crush him. (Hence our word *tantalize*, meaning to torment by holding out hopes or prospects which cannot be realized.)

Tarpeia (*tar-pē'ya*).—Daughter of the governor of the Roman citadel; was tempted by the gold bracelets of the Sabines, who, in the time of Romulus, were besieging the fortress, to treacherously open one of the gates. As they rushed in they threw their shields upon her and crushed her to death. The Tarpeian Rock (*tar-pē'yan*), from which criminals were hurled headlong, was named after her.

Tartarus (*tar'ta-rus*).—The place of punishment of the wicked in the lower world, as opposed to the Elysian Fields, the abode of the blessed. Sometimes it means the lower world generally.

Taygete (*tā-ij'et-ē*).—Daughter of Atlas and Pleione, one of the Pleiones.

Tecmessa (*tek-mes'sa*).—Daughter of Teleutas, king of Phrygia, and mistress of Ajax the Great.

Telamon (*tel'a-mōn*).—Son of Æacus and brother of Peleus. He was king of Salamis and father of Ajax the Great (or Telamonius) and of Teucer, the celebrated archer. He was one of the Argonauts, and took part in the Calydonian boar hunt.

Telegonus (*te-leg'on-us*).—Son of Ulysses and Circe. He killed his father without knowing it. See "Ulysses."

Telemachus (*tē-lem'ak-us*).—Son of Ulysses (*q.v.*) and Penelope.

Telephus (*tē'le-fus*).—Son of Hercules and king of Mysia. He married Laodice, daughter of Priam, king of Troy. He was wounded by the spear of Achilles, but was afterward cured by its rust.

Tenedos (*ten'e-dos*).—A small island in the Ægean Sea, off the coast of Troas. Hither the Greeks brought their fleet when they pretended to sail away from Troy (*q.v.*).

Tereus (*tē'rūs*).—Son of Mars, king of Thrace and husband of Procne, by whom he became the father of Itys. He hid Procne and married Philomela (*q.v.*). Procne killed her son Itys and served him up in a dish to Tereus. She then fled with her sister Philomela. Procne was afterwards changed into a swallow, Philomela into a nightingale, and Tereus into a hawk.

Terpsichore.—See "Musæ."

Tethys (*tē'this*).—Wife of Oceanus and mother of the sea-nymphs and sea-gods.

Teucer (*tū'ser*).—(i) Brother of Ajax the Great, and the most skillful archer among the Greeks before Troy. (ii) The first king of Troy: whence the Trojans are sometimes called Teucri.

Thalia.—See "Musæ."

Themis (*them'is*).—The goddess of justice and of prophecy. She is generally represented holding a cornucopia and a pair of scales.

Thersites (*ther-sī'tēz*).—A Greek before Troy, notorious for his ugliness and scurrility. He was killed by Achilles.

Theseus (*thē'sūs*).—The great legendary hero of Attica; was the son of Ægeus, king of Athens, and of Æthra. He went of his own accord as part of the yearly tribute of Athens to the Minotaur (*q.v.*). Ariadne, the daughter of Minos, however, fell in love with the hero, and gave him a sword wherewith he slew the monster, and a clue of threads by means of which he found his way out of the labyrinth. Theseus then sailed away in company with Ariadne, but he abandoned her (see "Ariadne") in the island of Naxos. When approaching Attica, he forgot to hoist the white sail, as a token of success, and so caused the death of his father (see "Ægeus"). Theseus thus became king of Athens. His life was full of adventure. He was an Argonaut, and took part in the Calydonian boar hunt. His friendship with Pirithous is proverbial. He even accompanied Pirithous into the lower world with the object of carrying off Proserpine (see "Pirithous"). On his return from the lower world he found himself unable to re-establish himself as king of Athens, and retired to the island of Scyros, where he was killed by Lycomedes, the king, who treacherously thrust him down a rock.

Thetis (*thet'is*).—A sea-nymph; daughter of Nereus and Doris, wife of Peleus and mother of Achilles. At her wedding with Peleus occurred the celebrated incident of the Golden Apple (see "Paris").

Thisbe (*this'be*).—A beautiful maiden of Babylon, beloved by Pyramus (*pī'ra-mus*).—Their parents being averse to their union, they used to converse secretly through a hole in the wall, as they lived in adjoining houses. Once they agreed to meet at the tomb of Ninus. Thisbe arrived first, but perceiving a lioness devouring an ox, she took flight. While running she lost her garment, which the lioness seized and soiled with blood. Meanwhile Pyramus came on the scene, and finding her garment soiled with blood, he imagined that she had been slain, and killed himself. Thisbe returned later, and finding the dead body of her lover killed herself also.

Thor.—In Scandinavian mythology the eldest son of Odin and Frigga; strongest and bravest of the gods. He launched the thunder, presided over the air and

the seasons, and protected man from lightning and evil spirits. His wife was Sif ("love"); his chariot was drawn by two he-goats; his mace or hammer was called Mjolner; his belt was Megin-giord, and whenever he put it on his strength was doubled; his palace, Thrudvangr, contained five hundred and forty halls; Thursday is Thor's day. This word means "refuge from terror."

Thyone (*thī-ō'nē*).—The name given to Semele when she was brought from the lower world by her son Bacchus and placed among the immortals.

Tiresias (*tī-res'i-as*).—A celebrated blind soothsayer of Thebes. He was blind from his seventh year; but lived to a great age. He was one of the most famous soothsayers in all antiquity.

Tiryns (*ti'rinz*).—A town in Argolis; one of the most ancient in all Greece, where Hercules was brought up. Remains of the city are still to be seen.

Tisiphone.—See "Furiæ."

Titanes (*tī-tā'nēz*).—The Titans; the six sons and six daughters of Uranus (Heaven) and Ge (Earth), who contended with Jupiter for the sovereignty of heaven, but were overcome by him and precipitated into Tartarus.

Tithonus (*tī-thō'nus*).—Son of Laomedon and brother of Priam. He was beloved by the goddess Aurora, who endowed him with immortality, but not with eternal youth. Consequently, with the gradual decay of nature, he became at length a decrepit old man, whose immortality with ever-weakening physical vigor became a terrible burden to him. Aurora eventually changed him into a grasshopper.

Trimurti.—The name of the Hindu triad of deities; or Brahma, Vishnu, and Siva united in one god-head, and spoken of as an inseparable unity.

Triptolemus (*trip-tol'em-us*).—Son of Celeus, king of Eleusis. He was the favorite of Ceres, and the inventor of the plow and agriculture: hence introduced civilization, which follows the latter. He introduced the worship of Ceres.

Triton (*trī'ton*).—A sea-god; son of Neptune, who blows through a shell to calm the sea. He is represented with a man's head and body, the lower part being that of a fish.

Troas (*trō'as*).—The region about Troy (or Ilium), forming one of the five parts into which Mysia, a district occupying the northwest corner of Asia Minor, was divided. Troas is frequently called *The Troad*.

Trollus (*trō'il-us*).—Son of Priam and Hecuba; slain by Achilles.

Troja (*trō'ja*), or **Troy,** called by the Greeks **Ilium** (*ī'li-um*).—A city of Asia Minor, situated in the Troad, famous for its ten years' siege by the Greeks. The name Troy was derived from king Tros (*trōs*), who gave his name originally to the district (Troas) and the people; Ilium from Ilus, son of Tros, who founded the city—which, however, was also called, after his father, Troy. The Trojan war forms the subject of Homer's immortal poem, the *Iliad*. The history of this celebrated war may be briefly told as follows: The war arose from the abduction of Helen, wife of Menelaus, king of Sparta, and the most beautiful woman of her time, by Paris, son of Priam, king of Troy. The cause of her abduction is given under "Paris" and "Helen." All the chiefs of Greece, who had been former suitors of Helen, joined Menelaus in an expedition to Troy to bring her back. They accordingly massed all their forces and sailed for the coast of Troas. Even the gods took an active part in the contest: Juno and Minerva, owing to the judgment of Paris, were hostile to the Trojans, and accordingly sided with the Greeks; while Venus, to whom Paris had awarded the golden apple, took the side of the Trojans. The innumerable incidents of the siege itself must be passed over; only the remarkable way in which, after a ten years' siege, the city was finally taken, must be told. The city contained an ancient statue of Pallas (*i. e.* Minerva), called the Palladium, (*q.v.*) on the preservation of which the safety of the city was supposed to depend. Accordingly the Greeks make a night attack on Troy, and Ulysses and Diomedes succeeded in carrying off this Palladium. A little later the Greeks returned to their ships and sailed away, pretending that they had relinquished the siege. On the plain before the city, however, they left behind them the celebrated *wooden horse*, the invention of Ulysses, which was hollowed out in the interior sufficiently to admit of the presence of its wily inventor and a few other heroes within it. Meanwhile Sinon, a relation of Ulysses, had allowed himself to be taken prisoner by the Trojans, and then persuaded them to draw this wooden horse, which he pretended was an atonement for the Palladium, into the city. They foolishly believed him and dragged the horse into the city, and in the dead of night Sinon let the Greeks out of the horse, and they at once set fire to the city. Meanwhile the main body of the Greeks, who had gone no farther than the island of Tenedos, returned and rushed through the gates of the city, opened by their friends within, and in this way the city was taken. The date most generally accepted for the capture of Troy is B. C. 1184.

Trolls.—Dwarfs of Northern mythology, living in hills or mounds; they are represented as stumpy, misshapen, and humpbacked, inclined to thieving, and fond of carrying off children or substituting one of their own offspring for that of a human mother. They are called hill-people, and are especially averse to noise, from a recollection of the time when Thor used to fling his hammer after them.

Tydeus (*ti'dūs*).—Son of Œneus, king of Calydon, and father of Diomedes, who was one of the principal Greek heroes at the Trojan war. Hence Diomedes is often called by his patronymic Tydides (*ti-dī'dēz*).

Tyndareus (*tin'dar-ūs*).—King of Sparta and husband of Leda. He invited Menelaus to come to Sparta, and handed over the kingdom to him.

Typhoeus (*ti-fō'ūs*), or **Typhon** (*ti'fon*).—A giant who wished to acquire the sovereign power over gods and men, but was overcome with a thunderbolt from Jupiter and buried under Mount Ætna.

Tyr.—In Norse mythology, a warrior deity, and the protector of champions and brave men; he was also noted for his sagacity. When the gods wished to bind the wolf Fenrir, Tyr put his hand into the demon's mouth as a pledge that the bonds should be removed again. But Fenrir found that the gods had no intention of keeping their word, and revenged himself in some degree by biting the hand off. Tyr was the son of Odin and brother of Thor.

U

Ulin.—An enchantress, who had no power over those who remained faithful to Allah and their duty; but if any fell into error or sin, she had full power to do as she liked. Thus, when Misnar (sultan of India) mistrusted the protection of Allah, she transformed him into a toad. When the Vizier Horam believed a false report, obviously untrue, she transformed him also into a toad. And when the Princess Hemjunah, to avoid a marriage projected by her father, ran away with a stranger, her indiscretion placed her in the power of the enchantress, who transformed her likewise into a toad. Ulin was ultimately killed by Misnar, sultan of Delhi, who felled her to the ground with a blow.

Ulysses (*ū-lis'ēz*), or **Ulixes** (*u-lix'ēz*); called **Odysseus** (*od-is'sūs*) by the Greeks.—A king of Ithaca, famed among the Grecian heroes of the Trojan war for his craft and eloquence; the son of Laertes, husband of Penelope, and father of Telemachus and Telegonus (by Circe). In order to escape from going with the other Greek heroes against Troy, he feigned madness, ploughing the sea-shore with a horse and bull yoked together and sowing salt. The imposture, however, was laid bare by Palamedes (*q.v.*), who placed Telemachus, the infant son of Ulysses, in the furrow, when the latter at once turned aside the plough; but the wily Ulysses had his revenge on Palamedes. Ulysses, in his turn, sought out and obtained the indispensable assistance of Achilles (*q.v.*). At the siege of Troy his cunning and valor were of the greatest service to the Greeks. In company with Diomedes he slew the horses of Rhesus, and also carried off the Palladium (*q.v.*). Perhaps the crowning effort of his ingenuity was the invention of the famous wooden horse, by means of which the city of Troy (*q.v.*) was ultimately taken by the Greeks. After the taking of Troy Ulysses set out for Ithaca, which, however, he did not reach for twenty years. During this time he passed through the adventures which form the subject of Homer's glorious poem, the *Odyssey*, which takes its name from Odysseus, the Greek name for Ulysses. He thus visited Circe (*q.v.*), Polyphemus (*q.v.*), the Lotophagi, and other persons and places. In order to get safely past the island of the Sirens, he, with his usual sagacity, devised special means, which proved entirely successful (see "Sirens"). He lost six of his companions while sailing between Scylla (*q.v.*) and Charybdis. He then suffered shipwreck, he alone escaping by means of the mast and planks. In ten days he was drifted on to the island of Ogygia, inhabited by Calypso (*q.v.*), with whom he stayed for eight years. He then constructed a raft, and made his way to the island of Scheria (*q.v.*), whence he obtained a ship that carried him to Ithaca. He did not, however, make himself known at once to his wife and son. In order to see how the land lay, he disguised himself

as a beggar, but was kindly received by the old swineherd. Meanwhile his son Telemachus, now grown up to manhood, returned from a journey to Pylos and Sparta, undertaken with a view to gleaning what information he could as to the probable whereabouts of his father. Ulysses then made himself known to Telemachus, and the two resolved on a plan of revenge on the numerous unfortunate suitors for the hand of the virtuous and constant Penelope (*q.v.*). With great difficulty she was induced (being, as yet, unaware of the safe arrival of her husband) to promise her hand to that suitor who could shoot with the bow of Ulysses. Not one of them, however, was able to draw this bow, whereupon Ulysses himself took it up and slew them all. He then made himself known to Penelope, and went to see his father Laertes, bowed down with grief and years. Now Circe, who had had a son, Telegonus, by Ulysses, sent him in search of his father. Telegonus encountered a storm which cast his ship on the coast of Ithaca, and being pressed by hunger, he began to plunder the fields. Ulysses and Telemachus hearing of this, went out against the spoliator; but Telegonus, not knowing Ulysses, ran him through the body with a spear given to him by his mother. Thus the famous hero died at the hands of his own son. Telegonus afterwards married Penelope, and became by her the father of Italus.

Urania (*ū-rā'ni-a*).—The muse of astronomy. See "Musæ."

Uranus (*ū'ra-nus*), or **Heaven.**—Husband of Gæa (Earth), and father of Oceanus, Hyperion, Rhea, Themis, Cronos, and other children. At the instigation of Gæa he was dethroned by Cronos.

Utgard-Loki.—The chief of the giants, in Norse mythology.

V

Varuna, or **Vrauna.**—In Hindu mythology, the deity who presides over the waters of the ocean, corresponding with *Neptune* of classic mythology.

Valhalla.—In Scandinavian mythology the palace of immortality wherein are received the souls of heroes slain in battle.

Valkyrs.—The battle-maidens of Scandinavian mythology. They were mounted on swift horses and held drawn swords. They rushed into battle and selected those destined to death and conducted them to Valhalla. The number of Valkyrs differs greatly according to the various mythologists and ranges from three to sixteen, the greater part of them, however, naming only nine.

Venus (*vē'nus*); called by the Greeks **Aphrodite** (*af-ro-dī'tē*)—*i. e.* "sea-foam."—The goddess of love and beauty. She was supposed to have sprung from the foam of the sea: hence her Greek name. She was the wife of Vulcan, but was very unfaithful to him. She loved the gods Mars, Bacchus, Neptune and Mercury, and the mortals Adonis and Anchises. She was considered by Paris (*q.v.*) the most beautiful of the goddesses and had awarded to her the celebrated Golden Apple. Anyone who wore her magic girdle immediately became beautiful and the object of love and desire. She is generally accompanied by her son Cupid. The month of April, as the commencement of spring, was considered peculiarly sacred to the goddess of love. The myrtle, rose, apple and poppy, and the sparrow, dove, swan and swallow, were all sacred to her. She was probably originally identical with Astarte, a Syrian goddess, called by the Hebrews Ashtoreth. As might have been anticipated, the representation of the Queen of Beauty on canvas and in marble has resulted in some of the finest works of the most celebrated painters and sculptors of antiquity. Among the former, Apelles' masterpiece of Venus rising from the sea deserves special mention; and among the latter the "Cnidian Venus" (so called because it stood in her temple at Cnidus), by Praxiteles, is unquestionably the most famous. Phryne (*q.v.*) sat as model for both of these noble works of art. The fame of the "Cnidian Venus" was so great that travelers from all parts of the civilized world resorted to Cnidus in order to see it. In fact, Pliny and others declared it to be the finest statue in the world. The "Venus of Milo" is, however, the noblest extant representation of Venus. It was found, in 1820, in the island of Melos, the modern Milo (hence the epithet), which is one of the group of islands named the Cyclades, in the Ægean Sea. It now forms one of the treasures of the Louvre, Paris.

Vertumnus (*ver-tum'nus*).—The god of the changing year—that is, of the seasons and their productions. His festival was celebrated by the whole Roman people on the 23rd of August.

Vesta (*ves'ta*); called by the Greeks **Hestia** (*hes'ti-a*)—*i. e.* "the hearth."—One of the twelve great Roman deities, the goddess and guardian of the hearth and home. She was the daughter of Saturn and Rhea. In her temple in the Forum at Rome stood no statue, the goddess being represented by the eternal fire burning on her altar as her abiding symbol. This fire was kept up and attended to by a number of virgin priestesses, called Vestals, who were chaste and pure like the goddess herself. On March 1 in every year the sacred fire was renewed, and on June 15 her temple was cleaned and purified.

Vidar.—The Scandinavian god of wisdom, noted for his thick shoes, and not infrequently called "The god with the thick shoes."

Vishnu.—In Hindu mythology one of the great deities of the Hindu triad, ranking as the *Preserver*, after Brahma, the *Creator*, and before Siva, the *Destroyer*. It is believed that he has appeared on earth nine times, his tenth *avatar*, or incarnation, having yet to come.

Volumnia (*vol-um'ni-a*).—Wife of Coriolanus (*q.v.*).

Vulcanus (*vul-kā'nus*), or **Vulcan;** called **Hephæstus** (*hē-fēs'tus*) by the Greeks. The god of fire. He was the son of Jupiter and Juno, and was lame from his birth. Besides being the god of fire, he was master of the arts which need the aid of fire, especially of working in metal. He made all the palaces of the gods on Olympus, the armor of Achilles, the fatal necklace of Harmonia, the fire-breathing and brazen-hoofed bulls of Æëtes (see "Argonautæ"), etc. The Cyclops were his workmen, and his workshops were situated under Mount Ætna in Sicily. Vulcan's wife was Venus. His favorite abode on the earth was the island of Lemnos. His great festival was celebrated on the 23rd of August.

W

White Lady.—In German folk-lore, the ancient Teutonic goddess Holda or Berchta, who was the receiver of the souls of maidens and children, and who still exists as the White Lady, not infrequently, in German legends, transforming herself, or those whom she decoys into her home, into a white mouse.

Wild Huntsman, The.—A spectral hunter in folk-lore, especially in German folk-lore; the subject of a ballad by Bürger.

Woden (*wō'den*), or **Wotan.**—The Anglo-Saxon form of the Scandinavian god Odin; Wednesday is called after him.

Y

Yama.—In the *Rigveda*, the name of the god who rules in heaven over the blessed—the Manes, Fathers, or Pitris—and is therefore called king.

Yggdrasil.—In Scandinavian mythology the great ash tree which binds together heaven, earth, and hell. Its branches extend over the whole earth, its top reaches heaven, and its roots hell. The three nornas, or fates, sit under the tree, spinning the events of man's life.

Z

Zem.—The sacred well of Mecca. According to Arab tradition, this is the very well that was shown to Hagar when with Ishmael in the desert. It is supposed to be in the heart of the city of Mecca.

Zephyrus (*zef'i-rus*).—The west wind, or properly, the northwest.

Zeus (*zūs*).—See "Jupiter."

Zohak.—The giant of Persian mythology who keeps the "mouth of hell." He was the fifth of the Pischdadian dynasty, and was a lineal descendant of Shedâd, king of Ad. He murdered his predecessor, and invented both flaying men alive and killing them by crucifixion. The devil kissed him on the shoulders, and immediately two serpents grew out of his back and fed constantly upon him. He was dethroned by the famous blacksmith of Ispahan, and appointed by the devil to keep hell-gate.

Zohara.—An oriental queen of love, and mother of mischief. When Harût and Marût were selected by the host of heaven to be judges on earth, they judged righteous judgment till Zohara, in the shape of a lovely woman, appeared before them with her complaint. They then both fell in love with her and tried to corrupt her, but she flew from them to heaven; and the two angel-judges were forever shut out.

Zulzul.—According to Chinese mythology the sage whose life was saved in the form of a rat by Gedy, the youngest of the four sons of Corcud. Zulzul gave him, in gratitude, two poniards, by the help of which he could climb the highest tree or most inaccessible castle.

EXPLANATORY CHART OF GREEK AND ROMAN MYTHOLOGY: SHOW

The relationship of these mythical personages are quite unlike those of mortals and are full of incon-
this chart is as consistent with their

CHAOS
Produced EREBUS, god of *darkness*, NOX, goddess of *night*, and TERRA, *Earth*.

TITAN
Oldest of the twelve Titans.

JUNO, wife and sister of Jupiter, queen of the gods, and of Heaven and Earth.

THE CYCLOPS
Giants, at first three in number:
Arges,
Brontes,
Steropes.

BRIAREUS
A famous giant called by men Ægæon, and by the gods Braireus.

TERRA or TITÆA produced CŒLUS or URANUS, *Heaven*

TETHYS
Wife of *Oceanus;* for offspring, see **Oceanus.**

THEA
Wife of *Hyperion;* the mother of rivers, and of about three thousand daughters, called *Ocean'i-des.*

JUPITER
or **Zeus,** the most powerful of all the gods; king of gods and men, had....

CŒLUS or URANUS, i. e. *Heaven*, and TERRA OR TITÆA, i. e. *Earth*. } had

SATURN
or **Cronos,**
god of Time, had by { *Rhea* / same as *Ops,* / same as *Cybele.* } .....

MNEMOSYNE
Mother of the nine *Muses.*

THEMIS
Mother of Astræa, goddess of Justice.

VESTA, the goddess of *fire,*

CYBELE
OPS or RHEA, wife of *Saturn;* the goddess of *all things;* styled *Magna Mater* or *Great Mother, Bona Mater* or *Good Mother;* for off-spring, see **Saturn.**

CERES, the goddess or *corn*

LATONA, celebrated for her

NEPTUNE, the god of the

PLUTO, the god of the

OCEANUS
The god of water, to whom the ancients recommended themselves when going on a voyage, had by Tethys.

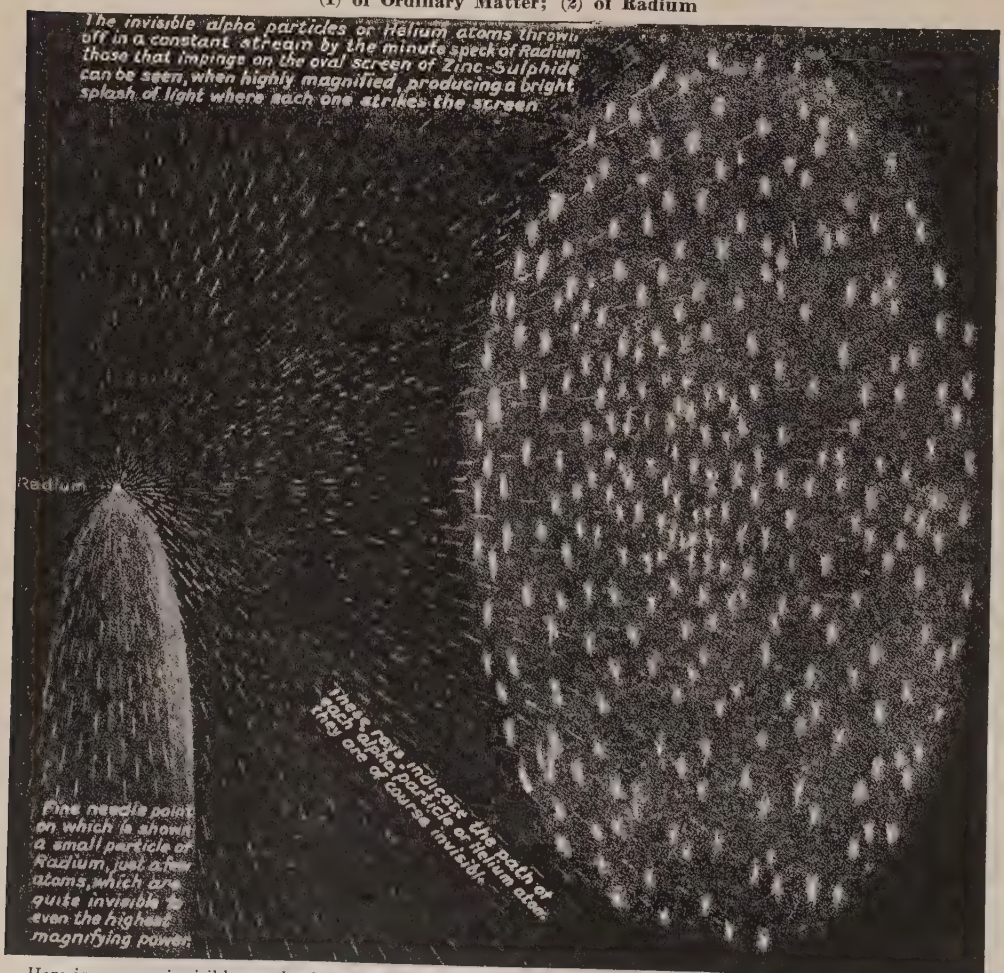
war; represented with two faces. His temple in Rome was open in time of war and shut in time of peace.

SCREENS OF LIGHT CAST BY INVISIBLE ATOMS

IMMENSELY ENLARGED REPRESENTATIONS OF ATOMS
(1) of Ordinary Matter; (2) of Radium



The invisible alpha particles or Helium atoms thrown off in a constant stream by the minute speck of Radium, those that impinge on the oval screen of Zinc-Sulphide can be seen, when highly magnified, producing a bright splash of light where each one strikes the screen
Radium
These rays indicate the path of each alpha particle of Helium atom they are of course invisible
Fine needle point on which is shown a small particle of Radium, just a few atoms, which are quite invisible even the highest magnifying power

Here is seen an invisible speck of radium throwing out invisible atoms that sparkle into sight on a film. This stream of atoms will pour forth for 2500 years before the radium ceases to exist, thus showing the marvelous energy stored up in the smallest particle. These flying particles fall on the screen or film like hailstones splashing on the surface of water, and the splash is visible, while the radium itself and flying atoms are not. This is the nearest men have yet come to seeing an actual atom.

RELATION OF THE GOVERNMENT TO SCIENCE

Science in its widest significance is sometimes defined as the correlation of all knowledge. In this sense it would include *philosophy*. In a more restricted and generally accepted sense, the term is applied to the *systematized* divisions of knowledge.

Science and philosophy *resemble* each other in so far as they both have to do with knowledge; but while the latter deals with the whole sum of knowledge and goes back to generalized first principles, the former takes up special branches of it. That is, a science is such in fact when a sufficient number of interrelated facts are so arranged and classified by referring them to the general truths and principles on which they are founded that they constitute a well-certified and more or less complete branch of knowledge.

From the present development of knowledge the separate entities of the universe are five—namely, ether, matter, energy, life, and mind. The first three are inseparable agents in the simplest phenomena that occur in nature. They may ultimately be reduced to two, or, conceivably, to one. It is with these that the various branches of science have to deal—to observe, to experiment, to classify, to define.

Classification of the Sciences.—The sciences may be grouped in two ways. *First*, from what has been said above, they may be divided into:

(a) the *physical* sciences, which have to do with inorganic nature—that is with the laws and properties of matter, energy, and ether;

(b) the *biological* sciences, which consider the laws of life; and

(c) the *psychical* sciences, which deal with the phenomena of mind.

Second.—Another, and probably more practical, division is that of (a) *pure* or *theoretic* sciences, and (b) *applied* or *practical* sciences. The latter consist of those branches which deal with facts, events, or phenomena as explained, accounted for, or produced by means of powers, causes, or laws; the former as the knowledge of these powers, causes, or laws, considered apart or as pure from all applications. To the class of pure or fundamental sciences belong mathematics, physics, chemistry, psychology, and sociology; to the applied or concrete belong geology, mineralogy, botany, zoology, meteorology, geography, ethics, politics, law, jurisprudence, logic, grammar, rhetoric, philology, and political economy; navigation, engineering, and practical mechanics; surgery, medicine, materia medica, etc.

Methods of Science.—The great method of scientific inquiry is *experiment*—the laboratory. Contrasted with experiment is *observation*. But even in astronomy, emphatically an observational science, experiment plays an important part. The dynamical knowledge which Newton developed into the cosmic law of gravitation was founded on experiment. Meteorology, again, has made great strides in these days by appealing to laboratory experiments for elucidation of its phenomena. Likewise in biology, botany, and zoology experiment has led to striking discoveries; while such branches as embryology and bacteriology are as truly experimental as chemistry itself.

In the psychical group of sciences the method of experimenting still awaits development. The complexity of the problems presented, and the manner in which they affect the welfare and happiness of humanity, render social and political experimenting excessively hazardous. Such sciences as those studied by the economist, the ethnologist, the moralist, or the theologian are of necessity essentially observational.

APPLIED ARITHMETIC, WEIGHTS AND MEASUREMENTS

It would be difficult to overestimate the extent to which mathematics enters into the conditions of everyday life. In its elementary stages, as the science of number, it teaches us the relations of magnitude, and enables us to build up a system of calculation and measurement which, applied to the relations observed to exist in nature, gives results of far-reaching importance.

The properties of number are investigated in arithmetic, and methods examined by which those engaged in practical science are able to work out their results to any degree of approximation.

With the help of algebra, we arrive at a system of logarithms by which many of these results may be reached with the minimum of labor.

The measurement of lines and angles, by methods investigated in geometry and trigonometry, enables us to calculate areas, and work out various problems met with in surveying, and is of the first importance in astronomy.

Arithmetic, which deals with the properties of number, forms the basis of all mathematical calculation. (For the *primary* treatment of numbers, see under The Child World.)

COMMON FRACTIONS

A *Fraction* is one or more of the equal parts into which a unit has been divided. A *Common Fraction* is expressed by two numbers; the one written above the line is called the Numerator, the one below, the Denominator: both, called the Terms, denote the value of the fraction.

Thus, in the fraction $\frac{3}{4}$, the denominator 4, denotes that a unit or whole thing has been divided into four equal parts; and the numerator 3, shows that three of those parts are taken or expressed in the fraction.

A *Proper Fraction* is one whose numerator is less than its denominator; as $\frac{1}{2}$, $\frac{3}{4}$, $\frac{7}{8}$, etc. Its value is always less than 1.

An *Improper Fraction* is one whose numerator is equal to, or greater than its denominator, as $\frac{5}{5}$, $\frac{9}{8}$, $\frac{3}{1}\frac{9}{2}$, etc. Its value is never less than 1.

A *Mixed Number* is a whole number and a fraction; as $3\frac{2}{5}$, $10\frac{1}{2}$, $6\frac{2}{3}$.

The mixed number means that there are whole things taken together with a fraction of another.

A *Complex Fraction* is one in which the numerator or denominator, or both, are fractions.

Thus $\frac{3\frac{1}{7}}{2\frac{3}{8}}$, $\frac{1}{\frac{5}{6}\times\frac{3}{4}}$, $\frac{1\frac{5}{1}\frac{5}{7}}{8}$, are complex fractions.

SIMPLE FRACTIONS

A very good method of learning the combinations in small fractions is by the use of paper or cardboard disks.

Cut out a large number of them, and, in order to avoid trouble later on, it might be better to have the disks all of one size—about 4 inches in diameter.

Learning the Fraction ½ With Disks

Explanation:—Take a circular disk and cut it into two equal parts. Then proceed in this manner: What is this part called? What is other part called? How many halves in the whole circle? One-half and one-half are what? One-half taken away from one leaves what? If I take a half two times, what do I get? How many halves in a whole?

Now I will write these—

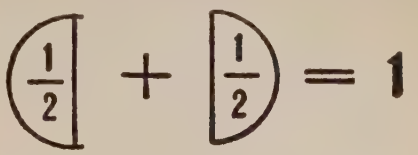
$\frac{1}{2}+\frac{1}{2}=$ $\qquad$ $1\div 2=$

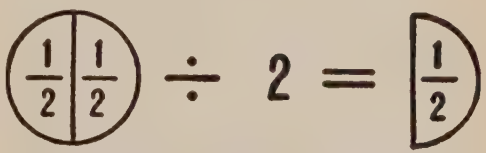
1 less $\frac{1}{2}=$ $\qquad$ $1-\frac{1}{2}=$

$2\times\frac{1}{2}=$ $\qquad$ 1 divided by $\frac{1}{2}=$

Give me the answers and I will write them.

Drawings showing the "placing" of disks for number combinations can then be made; as,





Make similar drawings to tell about halves.

Proceed like this—How many halves in a pie? If a pie cost 10 cents, what will half a pie cost? Who can tell other stories about halves? etc.

Learn fourths along with halves.

Learning the Fraction ⅓ and Others with Disks

Cut several disks into thirds and have children practice on cutting, so that they will be able to make the three parts of each disk equal. Frequently children will find pleasure in "teaching" one another.

Then proceed like this: What do you call each of these parts? Why are they called thirds? How many thirds in a circle? I am going to take a circle and cut it any way, so as to make three parts; do I call these unequal parts thirds? Why not? Let me write one-third on a piece of paper for you. (Write, ⅓.) Draw a circle for me. Instead of cutting it, draw lines where you would cut it to make thirds. Write one-third (⅓) on each third of a circle. I write this (⅓+⅓). Who can tell me what the answer is? Are two-thirds and two-thirds more than one? How much more? I have two-thirds of an apple and give Mary one-third, how much have I left? Who can give other story problems about thirds? Everybody try, etc.

Learn sixths along with thirds. Use disks, dots, marks, sticks, and inches to illustrate.

Remember that no advance should be made until each little part is understood. Then have fifths compared with fourths, thirds, and halves.

Teach tenths along with fifths.

When twelfths are taught, show the relations between twelfths and sixths, fourths, thirds, and halves.

Equal Fractions in Different Forms

Have the children see how fractions may differ in form but still remain the same in value.

Begin with his knowledge of smaller fractions as

$\frac{1}{2}, \frac{2}{4}, \frac{3}{6}, \frac{4}{8}$, and $\frac{5}{10}$ of an apple.

Let them show by the use of drawings that fractions may have large or small terms but be equal in value.

Write a number of proper fractions, improper fractions, and mixed numbers, and have the children pick out those of each kind; as,

$$\frac{3}{8},\ 27\tfrac{1}{2},\ \frac{5}{11},\ \frac{19}{20},\ \frac{20}{16},\ \frac{18}{5},\ \frac{11}{5},\ 3\tfrac{1}{2},\ 16\tfrac{2}{3}$$

Principles of Fractions

1. A fraction's value is the quotient obtained by dividing the numerator by the denominator.

$\frac{6}{2}=3$ 3 is the value of $\frac{6}{2}$

$\frac{2}{3}=\frac{2}{3}$ $\frac{2}{3}$ is the value of $\frac{2}{3}$

2. Multiplying the denominator of a fraction divides the fraction by that number.

$$\frac{1}{2\times4}=\frac{1}{8}\qquad \frac{3}{7\times3}=\frac{3}{21}\qquad \frac{2}{3\times9}=\frac{2}{27}$$

3. Dividing the denominator of a fraction multiplies the fraction by that number.

$$\frac{3}{8\div4}=\frac{3}{2}\qquad \frac{10}{9\div3}=\frac{10}{3}\qquad \frac{3}{10\div5}=\frac{3}{2}$$

4. Multiplying the numerator of a fraction multiplies the fraction by that number.

$$\frac{2\times2}{3}=\frac{4}{3}\qquad \frac{1\times8}{9}=\frac{8}{9}\qquad \frac{5\times3}{8}=\frac{15}{8}$$

5. Dividing the numerator of a fraction divides the fraction by that number.

$$\frac{4\div2}{7}=\frac{2}{7}\qquad \frac{12\div12}{16}=\frac{1}{16}\qquad \frac{3\div3}{7}=\frac{1}{7}$$

6. Multiplying both numerator and denominator of a fraction by the same number does not change the value of the fraction.

$$\frac{1\times3}{3\times3}=\frac{3}{9}=\frac{1}{3}\qquad \frac{6\times2}{7\times2}=\frac{12}{14}=\frac{6}{7}$$

7. Dividing both numerator and denominator of a fraction by the same number does not change the value of the fraction.

$$\frac{12\div3}{15\div3}=\frac{4}{5}=\frac{12}{15}\qquad \frac{18\div9}{27\div9}=\frac{2}{3}=\frac{18}{27}$$

Reduction of Fractions

is the process of changing their forms without altering their values.

To reduce a fraction to its lowest terms:

Rule.—Divide both terms by their greatest common divisor.

Reduce $^8/_{12}$ to its lowest terms.
Work: $4)\,^8/_{12}\,(^2/_3$ *Ans.* $^2/_3$

Four is the G. C. D. of 8 and 12; hence $^8/_{12}\div4=^2/_3$.

Reduce $^{35}/_{56}$ to its lowest terms.
Work: $7)\,^{35}/_{56}\,(^5/_8$ *Ans.* $^5/_8$

Seven is the G. C. D. of 35 and 56; hence $^{35}/_{56}\div7=^5/_8$.

A fraction whose terms have no common divisor is in its lowest terms, as $^9/_{16}$.

To reduce an improper fraction to a whole or mixed number:

Rule.—Divide the numerator by the denominator; the quotient will be the whole or mixed number.

How many units in $^{30}/_6$?
Work: $30\div6=5$ *Ans.* 5.

There are as many units in 30 sixths as 6 is contained times in 30.

Reduce $^{75}/_4$ to a mixed number.
Work: $75\div4=18+3$ *Ans.* $18\frac{3}{4}$.

In 75 fourths there are 18 units, and 3 fourths over, which equals $18\frac{3}{4}$.

To reduce a mixed number to an improper fraction:

Rule.—Multiply the whole number by the denominator of the fraction; add the numerator to the product, and write the sum over the denominator.

Reduce $18\frac{3}{4}$ to an improper fraction.
Work: $18\times4=72$ $^{72}/_4+^3/_4=^{75}/_4$ *Ans.* $^{75}/_4$.

In 18 are 72 fourths, plus the 3 fourths, equals 75 fourths.

To reduce two or more fractions to their least common denominator:

Rule.—Find the least common multiple of the given denominators for a common denominator. Then for each new numerator take such a part of this common denominator as the fraction is part of 1.

Reduce $\frac{1}{2}$, $\frac{2}{3}$ and $\frac{3}{4}$ to their L. C. D.

Work:

$$\frac{1}{2}=\frac{6}{12}\qquad \frac{2}{3}=\frac{8}{12}\qquad \frac{3}{4}=\frac{9}{12}$$

Ans. $^6/_{12}$, $^8/_{12}$ and $^9/_{12}$.

The L. C. M. of the denominators 2, 3 and 4 is 12. Hence, 12 is the L. C. D. to which the given fractions can be reduced. Then to change $\frac{1}{2}$ to 12ths, say, $\frac{1}{2}$ of 12 is 6, and write it over 12; to change $\frac{2}{3}$ to 12ths, say $\frac{2}{3}$ of 12 is 8, and write it over 12; to change $\frac{3}{4}$ to 12ths, say, $\frac{3}{4}$ of 12 is 9, and write it over 12.

Fractions must be reduced to a common denominator to be added or subtracted.

Addition of Fractions

If two or more fractions have the same denominator, their sum is obtained by adding the numerators.

Work: $\frac{1}{7}+\frac{4}{7}+\frac{5}{7}=\frac{1+4+5}{7}=\frac{10}{7}=1\frac{3}{7}$

If the fractions have different denominators, we must first express them as equivalent fractions with the same denominator.

Example 1: Find the value of

$$\frac{1}{9}+\frac{3}{7}+\frac{5}{21}+\frac{2}{3}$$

The lowest common multiple is 63. The several denominators, when divided into 63, give 7, 9, 3, 21 respectively, for quotients. Therefore, we multiply the numerators and denominators of the fractions by 7, 9, 3, 21, and add the numerators to obtain the required sum. The result must be reduced to a mixed number or to lower terms, if necessary.

Work:

$$\frac{1}{9}+\frac{3}{7}+\frac{5}{21}+\frac{2}{3}$$

$$=\frac{7+27+15+42}{63}$$

$$=^{91}/_{63}=1^{28}/_{63}=1\,^4/_9\ \textit{Ans.}$$

In adding mixed numbers, first add the whole numbers, then the fractions, finally adding the two results.

Example 2: Add together $3\frac{1}{8}+^7/_{24}+7^{11}/_{15}+4^3/_{20}$.

Given expression:

$$=3+7+4+\frac{1}{8}+\frac{7}{24}+\frac{11}{15}+\frac{3}{20}$$

$$=14+\frac{15+35+88+18}{120}$$

$$=14+\frac{156}{120}=14+1\frac{36}{120}=15\frac{3}{10}\ \textit{Ans.}$$

Subtraction of Fractions

The principle is the same as in addition. Reduce the fractions, if they have different denominators, to a common denominator, and then take the difference of the numerators.

Example 1: From $^{9}/_{11}$ subtract $^{3}/_{4}$.

$^{9}/_{11}-^{3}/_{4}=^{36}/_{44}-^{33}/_{44}=^{3}/_{44}$

Explanation. — Since the fractions are not similar they must be made similar before subtracting. The least common denominator of the given fractions is 44. $^{9}/_{11}=^{36}/_{44}$ and $^{3}/_{4}=^{33}/_{44}$. $^{36}/_{44}-^{33}/_{44}=^{3}/_{44}$.

When there are mixed numbers or integers subtract the fractions and the integers separately.

Note. — Mixed numbers may be reduced to improper fractions and subtracted according to the rule above.

Example 2. From $4^{1}/_{3}$ subtract $2^{5}/_{8}$.

$$\begin{array}{l} 4^{1}/_{3}=4\,^{8}/_{24} \\ 2^{5}/_{8}=2^{15}/_{24} \\ \hline 1^{17}/_{24} \end{array}$$

Explanation. — Since the numbers are composed of integers and fractions, the integers and the fractions may be subtracted separately.

The fractions must be first reduced to similar fractions. It is evident that $^{15}/_{24}$ cannot be subtracted from $^{8}/_{24}$, hence 1 or $^{24}/_{24}$ is taken from 4 and united with the $^{8}/_{24}$, making $^{32}/_{24}$. $^{15}/_{24}$ from $^{32}/_{24}$ leaves $^{17}/_{24}$, and 2 from 3 (the number left after 1 has been united with the fraction $^{8}/_{24}$) leaves 1. Hence the remainder is $1^{17}/_{24}$.

Example 3: Simplify $3^{2}/_{9}+4^{5}/_{7}-5^{13}/_{21}+^{2}/_{35}-1^{14}/_{15}$.

Given expression:

$$=3+4-5-1+\frac{2}{9}+\frac{5}{7}-\frac{13}{21}+\frac{2}{35}-\frac{14}{15}$$

$$=1+\frac{70+225-195+18-294}{315}$$

$$=1+\frac{313-489*}{315}$$

$$=\frac{628-489}{315}=\frac{139}{315}\ Ans.$$

*Obtained by adding all the numerators with + before them, and then all those with — before them.

Multiplication of Fractions

(i) When the multiplier is a whole number. This, as in the case of whole numbers, means that we have to find the sum of a given number of repetitions of the fraction.

Example 1:

$$\frac{7}{9}\times 4 \text{ means } \frac{7}{9}+\frac{7}{9}+\frac{7}{9}+\frac{7}{9}, \text{ i.e., } \frac{28}{9}; \text{ or } \frac{7\times 4}{9}$$

Hence, to multiply a fraction by a whole number, simply multiply the numerator by that number.

Since the multiplier thus becomes a factor of the numerator, we cancel any common factors contained in the multiplier and the denominator; and this may be done before we perform the actual multiplication:

Example 2: Multiply $^{19}/_{46}$ by 69.

$$\frac{19}{46}\times 69=\frac{19\times 69}{46}=\frac{19\times 3}{2} \text{ (cancelling 23), } =\frac{57}{2}=28\tfrac{1}{2}\ Ans.$$

It follows that if the multiplier be itself a factor of the denominator, we may, to multiply a fraction by a whole number, divide the denominator by that number.

(ii) When the multiplier is a fraction.

Example: In performing the operation 7×9, it is plain that we do to 7 what we do to a unit to obtain 9. Similarly, $^{3}/_{5}\times^{4}/_{11}$ may be looked upon as doing to $^{3}/_{5}$ what we do to the unit to obtain $^{4}/_{11}$.

Now, to obtain $^{4}/_{11}$ from the unit, we must divide the unit into 11 equal parts and take 4 of them.

Therefore, to find the value of $^{3}/_{5}\times^{4}/_{11}$ we must divide $^{3}/_{5}$ into 11 equal parts and take 4 of them.

But $^{3}/_{5}=^{33}/_{55}=^{3}/_{55}\times 11$, so that, the eleventh part of $^{3}/_{5}$ is $^{3}/_{55}$; and, if we take 4 of these parts, we get $^{3}/_{55}\times 4$ or $^{12}/_{55}$.

Thus, $\frac{3}{5}\times\frac{4}{11}=\frac{12}{55}$. Now $12=3\times 4$, and $55=5\times 11$.

Hence we have the following rule: To multiply two fractions together, multiply the numerators for a new numerator and the denominators for a new denominator.

As in Example 2 the work is shortened if we cancel common factors from the numerators and denominators.

Example: Multiply $^{22}/_{91}$ by $^{13}/_{77}$.

$$\text{The product}=\frac{\cancel{22}^{2}\times\cancel{13}}{\cancel{91}_{7}\times\cancel{77}_{7}}=\frac{2}{49}\ Ans.$$

Here, the 22 of the numerator and the 77 of the denominator contain a common factor, 11. Therefore, we cross out the 22 and write 2 above it, and cross out the 77 and write 7 under it. Similarly, we cancel the factor 13 from 13 and 91. There is now 2 left for numerator and 7×7 for denominator.

To multiply more than two fractions together, we proceed in the same way.

In multiplication of fractions, mixed numbers must first be expressed as improper fractions.

Example: Simplify $5^{1}/_{7}\times^{11}/_{27}\times 1^{11}/_{24}$.

$$\text{Given expression}=\frac{\cancel{8}^{1}}{\cancel{28}_{7}}\times\frac{11}{\cancel{27}_{9}}\times\frac{\cancel{25}^{5}}{\cancel{24}_{2}}=\frac{55}{18}=3\frac{1}{18}\ Ans.$$

Division of Fractions

(i) When the divisor is a whole number.

Suppose we have to divide $^{7}/_{9}$ by 4.

We know $^{7}/_{9}=^{28}/_{36}$. This fraction means that the unit is divided into 36 equal parts, and 28 of the parts taken. If we divide the 28 parts by 4, we get 7 of them—*i.e.* $^{7}/_{36}$. Hence $^{7}/_{9}\div 4=^{7}/_{36}$.

Therefore, to divide a fraction by a whole number, we multiply the denominator by that number.

In the same way as already explained for multiplication, we cancel any common factors contained in the divisor and the numerator. Hence, if the numerator be exactly divisible by the divisor, we may divide a fraction by a whole number by dividing the numerator by that number.

Example 1:

$$\frac{27}{31}\div 18=\frac{\cancel{27}^{3}}{31\times\cancel{18}_{2}}=\frac{3}{62}\ Ans.$$

Example 2:

$$\frac{36}{41}\div 9=\frac{4}{41}\ Ans.$$

(ii) When the divisor is a fraction.

In the operation $24\div 3$, we have to find the number which, when multiplied by 3, will give 24. Similarly, to find the value of $^{3}/_{7}\div^{5}/_{9}$ we have to find the fraction which, when multiplied by $^{5}/_{9}$, will give $^{3}/_{7}$.

But $\frac{3\times 9}{7\times 5}$ is the fraction which gives $\frac{3}{7}$ when multiplied by $\frac{5}{9}$. Therefore, $\frac{3}{7}\div\frac{5}{9}=\frac{3\times 9}{7\times 5}$.

Hence, to divide by a fraction, invert the divisor and multiply.

As in multiplication, mixed numbers must first be reduced to improper fractions.

EXAMPLE 3: Divide $3\frac{1}{14}$ by $5\frac{5}{42}$.

$$3\frac{1}{14}\div 5\frac{5}{42}=\frac{43}{14}\div\frac{215}{42}=\frac{\cancel{43}}{\cancel{14}}\times\frac{\overset{3}{\cancel{42}}}{\cancel{215}_{5}}=\frac{3}{5}\quad \textit{Ans.}$$

DECIMAL FRACTIONS

Differ in form from common fractions, in not having a written denominator; and from whole numbers, by having the decimal point (.) prefixed; which also separates the integral part from the decimal. The word decimal is derived from the Latin word *decem*, which signifies ten. The denominator of a decimal is always 10, or some power of 10, as 100, 1000, etc.

A Complex Decimal is a decimal with a common fraction at the right, as, .12½.

A Mixed Decimal is a whole number with a decimal fraction to its right, as, 34.5.

The denominations of United States money are based on the decimal system—the dollar occupying the unit's place, the dime the tenth's place, the cent the hundredth's place, and the mill the thousandth's place.

The rules given for addition, subtraction, and so on, also apply to decimals.

ADDITION IN DECIMALS

EXAMPLE: 27.295 + .0287 + 591.68 + 9.1846.

```
 27.295
   .0287
591.68
  9.1846
--------
628.1883 Ans.
```

Write the numbers so that the same powers of 10 come under one another, or, what is the same thing, write the numbers so that the decimal points come under one another. Then, adding the ten-thousandths first, 6, 13, carry 1, etc.

SUBTRACTION IN DECIMALS

EXAMPLE: Subtract .07295 from 21.651.

```
21.651
 .07295
-------
21.57805 Ans.
```

Write the first number under the second, so that the point comes under the point. Remember that we may consider there are 0's above the 9 and 5, since in 21.651 there are no ten-thousandths and no hundred-thousandths.

Say, mentally 5 and 5 make 10, carry 1.
10 and 0 make 10, carry 1.
3 and 8 make 11, carry 1, etc.

MULTIPLICATION IN DECIMALS

RULE.—Multiply as in whole numbers, and point off from the right of the product as many places as there are decimal places in both multiplier and multiplicand—prefixing ciphers if necessary.

EXAMPLE 1: What is the product of .417 multiplied by .34?

```
 .417
 .34
-----
 1668
 1251
-------
.14178 Ans.
```

EXPLANATION.—The numbers may be multiplied as though they were integers. Since the multiplier contains 2 decimal places, and the multiplicand 3 decimal places, the product will contain 5 decimal places and the decimal point is placed before the fifth figure counting from the right.

EXAMPLE 2: Multiply 7.5864 by 200.

```
 7.5864
    200
---------
1517.28 Ans.
```

EXPLANATION.—Since each removal of a figure one place to the left increases its value tenfold, the removal of the decimal point one place to the right multiplies by 10, and two places by 100. The product of 7.5864×100 is therefore 758.64, and this multiplied by 2 gives the product of 7.5864×200, which is 1517.28.

Note.—The number of decimal places in the product will always be equal to the sum of the number of decimal places in the multiplier and the multiplicand. Thus, in Example 2, there are two places of decimals (*i.e.* two figures to the right of the point) in 31.56, and two places of decimals in 5.49; and we found 2+2=4 places in the product 173.2644.

To multiply a decimal by 10, 100, etc.

RULE.—Remove the (.) as many places to the right as there are ciphers in the multiplier.

WORK:
8.75× 10= 87.5
8.75× 100= 875.
8.75×1000=8750.

DIVISION OF DECIMALS

RULE.—Divide as in whole numbers, annexing ciphers to the dividend, if necessary; then point off from the right of the quotient as many places as the decimal places in the dividend exceed those in the divisor—prefixing ciphers if necessary.

(a) Division of a decimal by a whole number.

EXAMPLE 1: Divide 18.2754 by 4.

```
4)18.2754
---------
 4.56885
```

We divide 4 into 18 (units) and have 4 (units) quotient and 3 units remainder. Since the 4 is the unit's figure of the quotient, we write the decimal point immediately after it. Then, the 2 units remainder and the 2 tenths of the dividend make 22 tenths to be divided by 4, and so on. Having reached the 4 (ten-thousandths) of the dividend, we find 8 (ten-thousandths) quotient and 2 remainder. This remainder is 20 hundred-thousandths, which when divided by 4 gives 5 (hundred-thousandths) and no further remainder.

EXAMPLE 2: Divide 18.2758 by 11.

```
11)18.2758
----------
 1.66143636
```

Here we find the digits 3, 6 repeated indefinitely in the quotient. Decimals of this sort will be fully considered later.

EXAMPLE 3: Divide 354.43 by 184.

```
184)354.43(1.92625 Ans.
 184
 ---
 1704
 ----
  483
  ---
 1150*
 ----
  460
  ---
  920
```

Here we find the first figure of the quotient is obtained by dividing 184 into 354 units. Having now reached the decimal point in the dividend we also put the decimal point in the answer, and go on as before.

*At this stage there is a remainder 115 hundredths. We bring down 0 from the dividend, and obtain 1150 thousandths, etc.

(b) Division of a decimal.

EXAMPLE 4: Divide 10.6603 by 7.85.

Thus:

```
785)1066.03(1.358 Ans.
 785
 ---
 2810
 ----
  4553
  ----
  6280
  ----
```

Here 7.85 is 785 hundredths, and 10.6603 is 1066.03 hundredths; so that the required quotient is obtained by dividing 1066.03 by 785.

Therefore, to divide by a decimal, move the point as many places to the right as will make the divisor a whole number; move the point in the dividend the same number of places to the right. Then proceed as in Example 3.

EXAMPLE 5: Divide 176.4 by .00012.

```
12)17640000
-----------
Ans.1470000
```

Here, to make the divisor a whole number, we have to move the point 5 places. Therefore we also move the point 5 places to the right in the dividend, first writing enough 0's after the 176.4 to enable us to do so.

To divide a decimal by 10, 100, etc.

RULE.—Remove the (.) as many places to the left as there are ciphers in the divisor.

WORK:
62.5÷ 10=6.25
62.5÷ 100= .625
62.5÷1000= .0625

Expression of decimal fractions as common fractions.

EXAMPLE: Express 5.375 as a common fraction.

.375 = 375 thousandths.

Therefore $5.375 = 5\frac{375}{1000} = 5\frac{3}{8}$ *Ans.*

RULE.—*Take the digits of the decimal for numerator; for the denominator put down 1 followed by as many ciphers as there are digits in the decimal. Reduce this fraction to its lowest terms.*

Expression of common fractions as decimals.

We have seen that a common fraction represents the quotient of the numerator divided by the denominator. Therefore, to convert a common fraction to a decimal fraction, we divide the numerator by the denominator.

EXAMPLE: Express $\frac{3}{8}$ as a decimal.

4)3.0

8) .75

.09375 *Ans.*

It will be found in many cases that there is always a remainder, so that the quotient can be continued indefinitely.

CIRCULATING DECIMALS

The learner has already discovered that some common fractions cannot be changed to exact decimal fractions, as—

$\frac{1}{3} = .33333$ on to infinity.
$\frac{2}{3} = .66666$ on to infinity.
$\frac{7}{33} = .212121$, etc.

These decimals are known as *Circulates*, *Recurring* or *Circulating* decimals.

The part which recurs is called the *Repetend*. This is marked by putting a dot over the first and last figures of it. For instance, if we write the 21 in the last case above, this way: $.\dot{2}\dot{1}$, it indicates that, if written out, the result would be 21212121, etc., on to infinity.

Where a circulating decimal occurs in work, it is best to reduce it to a common fraction. If need be, it may be expressed in the result as a circulate to any number of decimal places.

To change a pure circulate to a common fraction.

RULE.—Omit the (.) and write the figures of the repetend for the numerator, and as many 9's for the denominator as there are places in the repetend.

EXAMPLES: Change the pure circulates $.\dot{3}$, $.\dot{2}\dot{7}$, $.\dot{1}42857\dot{1}$, to common fractions.

$.\dot{3}, \left(\frac{3}{9} = \frac{1}{3}\right)$ *Ans.* $\frac{1}{3}$. $.\dot{2}\dot{7}, \left(\frac{27}{99} = \frac{3}{11}\right)$ *Ans.* $\frac{3}{11}$.

$.\dot{1}42857\dot{1}, \left(\frac{142857}{999999} = \frac{1}{7}\right)$ *Ans.* $\frac{1}{7}$.

To change a mixed circulate to a common fraction.

RULE.—From the whole decimal subtract the finite part, and make the remainder the numerator. For the denominator, write as many 9's as there are figures in the repetend, and annex as many 0's as there are finite places.

EXAMPLE: Change the mixed circulates $.1\dot{6}$ and $.41\dot{6}$ to common fractions.

$16 - 1 = 15, \frac{15}{90} = \frac{1}{6}$. *Ans.* $\frac{1}{6}$.

$416 - 41 = 375, \frac{375}{900} = \frac{5}{12}$. *Ans.* $\frac{5}{12}$.

To add, subtract, multiply and divide circulates, reduce them to common fractions, then apply the respective rules.

SHORT METHODS IN MERCHANDISING

When one of the numbers is an *aliquot part* of 100, the process of multiplication and division can often be very much shortened, as shown below.

Find cost of 27 yards of goods at $16\frac{2}{3}$c ($\frac{1}{6}$) per yard. At $1 per yard, 27 yards cost $27; at $\frac{1}{6}$, (27 ÷ 6), $4\frac{1}{2}$. *Ans.* $4\frac{1}{2}$.

Find cost of a bale of cotton, 528 pounds at $8\frac{1}{3}$c ($\frac{1}{12}$) per pound. At $1 per pound, 528 pounds cost $528; at $\frac{1}{12}$ (528 ÷ 12) $44. *Ans.* $44.

Find cost of 1845 pounds of iron, at $3\frac{1}{3}$c ($\frac{1}{30}$) per pound. Take $\frac{1}{30}$ of 1845, since $3\frac{1}{3}$c is $\frac{1}{30}$ of $1. (1845 ÷ 30 = $61\frac{1}{2}$). *Ans.* $61\frac{1}{2}$.

Find cost of 16 pounds of butter at $37\frac{1}{2}$c ($\frac{3}{8}$) per pound. Here we take $\frac{3}{8}$ of 16. Say $\frac{1}{8}$ of 16 is 2, and $\frac{3}{8}$ is (2 × 3) 6. Or say 3 times 16 is 48, and $\frac{1}{8}$ of 48 is 6. *Ans.* $6.

Find cost of $17\frac{1}{2}$ bushels of apples at 75c ($\frac{3}{4}$) per bushel. The shortest way to find $\frac{3}{4}$ of $17.50 is to diminish it by $\frac{1}{4}$ of itself.

4)17.50 at $1

$4.37\frac{1}{2}$ at $\frac{1}{4}$
$13.12\frac{1}{2}$ at $\frac{3}{4}$

Ans. $13.12\frac{1}{2}$.

At $6\frac{1}{4}$c per pound how much sugar will $5 buy? As $6\frac{1}{4}$c is $\frac{1}{16}$ of $1, evidently each dollar will buy 16 pounds. *Ans.* 80 pounds.

In multiplying by a fraction, write the quantity in a line with the numerator and cancel common factors.

Find cost of 72 yards of carpet, at $87\frac{1}{2}$c ($\frac{7}{8}$) a yard. Cancel 8, also 72 and write 9 instead. *Ans.* $63.

$$\frac{7 \times \cancel{72}\,9}{\cancel{8}} = 63$$

Of 28 pounds of coffee, at $18\frac{3}{4}$c ($\frac{3}{16}$) per pound Cancel 28 and 16, write 7 and 4. *Ans.* $5\frac{1}{4}$.

$$\frac{3 \times \cancel{28}\,7}{\cancel{16}\,4} = \frac{21}{4} \text{ or } 5\frac{1}{4}$$

At $66\frac{2}{3}$c ($\frac{2}{3}$) per bushel, how many bushel of wheat will $34 buy? *Ans.* 51 bushel.

$$\frac{3 \times \cancel{34}\,17}{\cancel{2}} = 51$$

In division, invert terms of fraction.

How much syrup, at $41\frac{2}{3}$c ($\frac{5}{12}$) per gallon can be bought for $15? *Ans.* 36 gallons.

$$\frac{12 \times \cancel{15}\,3}{\cancel{5}} = 36$$

TABLE OF ALIQUOT PARTS OF 100

$3\frac{1}{3}$ is $\frac{1}{30}$	25 is $\frac{1}{4}$	50 is $\frac{1}{2}$	75 is $\frac{3}{4}$
$6\frac{1}{4}$ is $\frac{1}{16}$	$31\frac{1}{4}$ is $\frac{5}{16}$	$56\frac{1}{4}$ is $\frac{9}{16}$	80 is $\frac{4}{5}$
$8\frac{1}{3}$ is $\frac{1}{12}$	$33\frac{1}{3}$ is $\frac{1}{3}$	$58\frac{1}{3}$ is $\frac{7}{12}$	$81\frac{1}{4}$ is $\frac{13}{16}$
$12\frac{1}{2}$ is $\frac{1}{8}$	$37\frac{1}{2}$ is $\frac{3}{8}$	60 is $\frac{3}{5}$	$83\frac{1}{3}$ is $\frac{5}{6}$
$16\frac{2}{3}$ is $\frac{1}{6}$	40 is $\frac{2}{5}$	$62\frac{1}{2}$ is $\frac{5}{8}$	$87\frac{1}{2}$ is $\frac{7}{8}$
$18\frac{3}{4}$ is $\frac{3}{16}$	$41\frac{2}{3}$ is $\frac{5}{12}$	$66\frac{2}{3}$ is $\frac{2}{3}$	$91\frac{2}{3}$ is $\frac{11}{12}$
20 is $\frac{1}{5}$	$43\frac{3}{4}$ is $\frac{7}{16}$	$68\frac{3}{4}$ is $\frac{11}{16}$	$93\frac{3}{4}$ is $\frac{15}{1}$

This table embodies all the aliquot parts of 100 and their equivalent fractions which are generally used in practical calculations.

PROBLEMS IN GRAIN, STOCK, COTTON, COAL, HAY, LUMBER, ETC.

To find the value of articles sold by the unit, hundred or thousand.

RULE.—Multiply the quantity by the price, or vice versa, and point off the proper number of decimal places in the result.

Find the cost of a bale (518 pounds) of cotton at $7\frac{3}{8}$c per pound.

518 × .07 = 36.26 At 7c (.07) per pound. 518 pounds
" .00$\frac{3}{8}$ = 1.94$\frac{1}{4}$ cost $36.26; at $\frac{3}{8}$c. 1.94\frac{1}{4}$. For
$\frac{3}{8}$ of 518, multiply by 3, and divide
Ans. 38.20\frac{1}{4}$ product by 8.

Find cost of a lot of hogs, weighing 8740 pounds, at $43.35 per hundredweight.

87.40 The price being $4.35 per 100 pounds
4.35 and as in 8740 pounds there are 87.40
380.1900 hundredweight, four decimal places are pointed off. *Ans.* $380.19.

Find the cost of 2864 feet of lumber, at $17¼ per 1000 feet.

Price being dollars per 1000, point off three places. (2.864 × 17¼ = 49.404.) *Ans.* $49.40.

To find the value of articles sold by the ton (2000 pounds).

RULE.—Multiply the weight by the price and take half of the product.

Find the cost of 2680 pounds of hay, at $11½ per ton.

Point off three places, when price is dollars; five if dollars and cents. (2680 × 11½ = 30820; 30820 ÷ 2 = 15.410.) *Ans.* $15.41.

When the long ton of 2240 pounds is used.

RULE.—Multiply the weight by the price and divide the product by 2.240.

Find the cost of 4800 pounds coal, at $6¾ per long ton. (4800 × 6¾) ÷ 2.24 = $14.46, *Ans.*

To find the cost of grain, when the price per bushel and weight is given.

RULE.—Reduce the weight to bushels, and multiply by the price.

Find the cost of 3570 pounds of shelled corn, at 36c per bushel.

56)3570 (63.75 bu. To reduce pounds of shelled corn
.36 to bushels, divide by 56. At 36c
Ans. $22.9500 per bushel, 63.75 bushels come to $22.95.

Find cost of 2900 pounds of wheat, at 57c per bushel.

To reduce pounds of wheat to bushels divide by 60. 2900 ÷ 60 = 48⅓ bushels; 48⅓ × .57 = $27.55, *Ans.*

In computing the value of grain, the operation can often be abbreviated by cancellation.

RULE.—Write the weight and price per bushel, on the right of a vertical line, and the number of pounds to the bushel on the left. Then cancel common factors, as explained above.

Find the cost of 3230 bushels of wheat, at 72c per bushel.

60 | 3230 Here we cancel the 0's on both
72 | 12 sides; then, 6 and 72, which leaves
323 × 12 = 38.76 323 and 12. Their product being the answer.

At 28c per bushel, what will 4080 pounds of oats cost?

32 | 4080 510 Oats, 32 pounds to the bushel. See
4 | 28 7 table, page 861. Cancel 32 and 4080, then,
Ans. $35.70 4 and 28, leaving the factors 510 and 7.

Other short cuts for computing cost of merchandise, produce, etc.

Find cost of 26½ dozen eggs, at 18½c a dozen.

26 × 18 = 4.68 When both fractions are ½.
½ of 44 = .22 To product of the whole numbers,
add ½ of their sum, and annex
½ × ½ = ¼ 4.90¼ ¼ to answer.
Ans. $4.90.

Of 53¾ pounds of butter, at 28¾c per pound.

53 × .28 = 14.84 To the product of the whole
¾ of 81 = .60¾ numbers, add ¾ of their sum,
plus the square of ¾.
¾ × ¾ = 9/16 15.45
Ans. $15.45 9/16.

Of 13¼ yards of flannel, at 31¼c per yard.

13 × .31 = 4.03 + .11 = 4.14, *Ans.*

To 4.03 add .11, ¼ of 44 (13 + 31). The 1/16 (¼ × ¼) is disregarded.

DENOMINATE NUMBERS

Simple denominate numbers.—When we speak of measures, whether they are of money, extension, time, or weight, we use terms like 5 dollars, 4 yards, 3 hours, or 10 pounds to express the quantity we are talking about.

Sometimes we use two or more terms or names to express the measure, as 3 hours, 15 minutes, 10 seconds; 4 gallons, 3 quarts, 1 pint. *These are compound denominate numbers.*

The chief differences between compound numbers and simple numbers is, that with the exceptions of United States money, and the metric system of weights and measures, the denominations of compound numbers do not increase or decrease by the scale of ten.

REDUCTION.—Reduction of Compound Numbers is the process of changing them from one denomination to another without altering their value.

Reduction Descending is changing the denomination of a number to another that is lower as: 2 hours = 120 minutes; 2 feet = 24 inches.

Reduction Ascending is changing the denomination of a number to another that is higher, as: 120 minutes = 2 hours; 24 inches = 2 feet.

RULES FOR ADDITION OF DENOMINATE NUMBERS

First.—Write the names of the different units to be used in addition, placing them in a horizontal row, the largest to the left.

Next.—Write the numbers of each unit to be added, below the names of the units, each in its proper place.

Then.—Add and place each sum below the column added.

EXAMPLE: Add 7 hours 15 minutes 30 seconds, 9 hours 30 minutes 40 seconds, and 11 hours 40 minutes 32 seconds.

WORK:

hours	minutes	seconds
7	15	30
9	30	40
11	40	32
28	26	42

EXPLANATION: 32 seconds + 40 seconds + 30 seconds = 102 seconds. But, 102 seconds = 1 minute 42 seconds. Write the 42 below and carry the 1 minute. 1 minute (carried) + 15 minutes + 30 minutes + 40 minutes = 86 minutes. But, 86 minutes = 1 hour 26 minutes. Write the 26 and carry the 1 hour. 1 hour + 11 hours + 9 hours + 7 hours = 28 hours. Result = 28 hours 26 minutes 42 seconds.

SUBTRACTION OF DENOMINATE QUANTITIES

EXAMPLE: Subtract 6 tons 12 cwt. 9 pounds 10 ounces from 15 tons 7 cwt. 13 pounds 9 ounces.

WORK:

Tons	Cwt.	Pounds	Ounces
15	7	13	9
6	12	9	10
8	15	3	15

EXPLANATION: (1) Place as in addition of denominate quantities. 10 ounces cannot be taken from 9 ounces, so we must take 1 pound from the 13 pounds and add it to the nine ounces. 16 ounces + 9 ounces = 25 ounces. 25 − 10 = 15. Write the 15 below.

(2) Now there are only 12 pounds left to take the 9 from. 12 − 9 = 3. Write the 3 below.

(3) 12 is larger than 7. 1 ton + 7 cwt. = 27 cwt. 27 − 12 = 15. Write the 15 below.

(4) 14 − 6 = 8. Write the 8 below.

(5) Result = 8 tons 15 cwt. 3 pounds 15 ounces.

MULTIPLICATION OF DENOMINATE QUANTITIES

EXAMPLE: Multiply 21 yards 2 feet 11 inches by 6.

WORK:

Yards	Feet	Inches
21	2	11
		6
131	2	6

EXPLANATION: (1) 6 × 11 inches = 66 inches = 5 feet 6 inches. Write the 6 below and carry the 5.

(2) 6 × 2 feet = 12 feet. 12 feet + 5 feet (carried) = 17 feet, or 5 yards 2 feet. Write the 2 below and carry the 5.

(3) 6 × 21 yards = 126 yards. 126 yards + 5 yards = 131 yards.

(4) Result = 131 yards 2 feet 6 inches.

Division of Denominate Quantities

Problem: Divide 3 years 9 months 4 days by 12.

Work

	Years	Months	Days	Hours
12)	3	9	4	0
	0	3	22	20

Explanation: (1) We cannot divide 3 by 12, so we reduce 3 years to months. 3 years = 36 months. 36 months + 9 months = 45 months. 45 ÷ 12 = 3, and a remainder 9. Write the 3 and carry the remainder 9.

(2) 9 months (carried) = 270 days. 270 days + 4 days = 274 days. 274 ÷ 12 = 22, and a remainder 10. Write the 22 and carry the 10.

(3) 10 days = 240 hours. 240 ÷ 12 = 20. Write the 20.

(4) Result = 3 months 22 days 20 hours.

Reduction Ascending

Rules: 1. Divide the given denomination by the number which will reduce it to the next higher denomination. Divide the quotient in the same manner, and continue the operation until the entire quantity is reduced.

2. To the last quotient annex the several remainders in their proper order. The result will be the answer.

Example: Reduce 201458 inches to higher denominations.

Work:

		Solution:
12	201458 inches	201458 inches = 16788 feet 2 inches.
3	16788 feet 2 inches	16788 feet 2 inches = 5596 yards 2 inches.
5½	5596 yards	5596 yards 2 inches = 1017 rods 2 yards 1 foot 8 inches
2		
11	11192 half yards	
320	1017 rods 5 half yards	1017 rods 2 yards 1 foot 8 inches = 3 miles 57 rods 2 yards 1 foot 8 inches.
	3 miles 57 rods	
	2 yds. 1 ft. 6 in.	

201458 inches = 3 miles 57 rods 2 yards 1 foot 8 inches.

Reduction Descending

Rules: 1. Write the given quantity in the order of its denominations, beginning with the highest, and supply vacant denominations with ciphers.

2. Multiply the highest denomination by the number which will reduce it to the next lower denomination, and add to the product the units of the lower denomination, if there be any.

3. Proceed in the same manner until the entire quantity is reduced to the required denomination.

Example: Reduce 10 yards 8 feet 10 inches to inches.

Work:

Yards	Feet	Inches
10	8	10
3		
38		
12		
456		
10		
466		

Solution: 10 yards = 10 × 3 feet = 30 feet. 30 feet and 8 feet are 38 feet.

38 feet = 38 × 12 inches, or 456 inches. 456 inches + 10 inches = 466 inches.

Note.—To prove the above work, use reduction ascending, beginning with the result.

Long or Linear Measure

Long or linear measure is used in measuring lines and distances.

There are two systems in use in the United States, the *English System* and the *French System*. The English system is the one commonly used, while the French system is used in making scientific measurements. (See under Metric System.)

Table of Long Measure

12 inches (in.)	= 1 foot (ft.)
3 feet	= 1 yard (yd.)
5½ yards, or 16½ feet	= 1 rod (rd.)
320 rods, or 5280 feet	= 1 mile (mi.)
1760 yards	= 1 mile

mi. rd. yd. ft. in.
1 = 320 = 1760 = 5280 = 63360

Architects, carpenters, and mechanics frequently write ′ for foot, and ″ for inch. Thus 8′ 7″ means 8 feet 7 inches.

Other measures of length are:

1 hand = 4 in. Used in measuring the height of horses.
1 fathom = 6 ft. Used in measuring depths at sea.
1 knot, nautical or geographical mile = 1.1526⅔ miles or 6086 feet.

The knot is used in measuring distances at sea. It is equivalent to 1 minute of longitude at the equator.

Surveyors' Linear Measure

7.92 inches	= 1 link (l.)
25 links	= 1 rod (rd.)
4 rods or 100 links	= 1 chain (ch.)
80 chains	= 1 mile (mi.)

mi. ch. rd. l. in.
1 = 80 = 320 = 8000 = 63360

The linear unit commonly employed by surveyors is Gunter's chain, which is 4 rods or 66 feet.

An Engineers' Chain, used by civil engineers, is 100 feet long, and consists of 100 links.

Measures of Length

The following measures of length are also used:

3 barleycorns	= 1 inch. Used by shoemakers.
4 inches	= 1 hand. Used to measure the height of horses.
6 feet	= 1 fathom. Used to measure depths at sea.
3 feet	= 1 pace. Used in pacing distances.
5 paces	= 1 rod.
8 furlongs	= 1 mile.
1.15 statute miles	= 1 geographical, or nautical mile.
3 geographical miles	= 1 league.
60 geographical miles, 69.16 statute miles	= 1 degree of Latitude on a Meridian, or of Longitude on the Equator.

The length of a degree of latitude varies. 69.16 miles is the average length, and is that adopted by the United States Coast Survey.

The standard unit of length is identical with the imperial yard of Great Britain.

The standard yard, under William IV., was declared to be fixed by dividing a pendulum which vibrates seconds in a vacuum, at the level of the sea, at 62 degrees Fahrenheit, in the latitude of London, into 391,393 equal parts, and taking 360,000 of these parts for the yard.

The following denominations also occur: The span = 9 inches; 1 common cubit (the distance from the elbow to the end of the middle finger) = 18 inches; 1 sacred cubit = 21.888 inches.

Surface Measures

Square Measure, used in measuring surfaces, such as cloth, ceilings, floors, etc.; paving, glazing, and stone-cutting, by the square foot; roofing, flooring, and slating by the square of 100 feet.

A surface has two dimensions, length and breadth.

A square is a figure that has four equal sides and four right angles.

The unit of measure for surfaces is a square, each of whose sides is a linear unit. Thus, a square inch is a square, each of whose sides is one inch long; a square foot is a square, each of whose sides is one foot long, etc.

The area of a square is the product of two of its sides. Thus, the area of a surface 3 feet square is 3 × 3 = 9 square feet.

Hence, to find the area of a rectangle:

Rule.—Multiply the length by the breadth expressed in units of the same denomination.

As the area of a rectangle is found by taking the product of the numbers representing its length and breadth, it is evident that if the area be divided by either of those numbers, the quotient will be the other number. Hence, to find either side of a rectangle when its area and the other side are given:

RULE.—Divide the area by the given side. The quotient will be the required side.

TABLE OF SQUARE MEASURE

144 square inches (sq. in.)	= 1 square foot (sq. ft.)
9 square feet	= 1 square yard (sq. yd.)
30¼ square yards	= 1 square rod (sq. rd.)
160 square rods	= 1 square mile (sq. mi.)
640 acres	= 1 square mile (sq. mi.)

Sq. ′ and sq. ″ are frequently used for square foot and square inch. Thus, 15 sq.′ 6 sq.″ means 15 square feet 6 square inches.

A square is 100 square feet. It is used in measuring roofing.

PRACTICAL APPLICATION OF SQUARE MEASURE

PAPERING

Facts about Wall Paper:

(1) Wall paper in this country is ½ yard wide, and comes in rolls 8 yards long, or in double rolls, 16 yards long.

(2) It is sold by the roll only.

(3) Bordering is sold by the linear yard.

(4) Make liberal allowances for waste in matching figures.

(5) If the border is wide, the strips need not extend to the ceiling.

Rules for Measuring:

(1) Measure the distance around the room in feet.

(2) Deduct the width of doors and windows.

(3) Divide the difference by 1½, and the quotient will be the number of strips needed.

(4) Multiply the number of strips by the number of yards in a strip, and the product is the *number of yards needed*, approximately.

(5) Divide the number of yards by 8, and the result is the *number of single rolls needed.*

EXAMPLE: A room of ordinary height, 16 feet by 24 feet, has three windows and 2 doors, each 4 feet wide. How many rolls of paper are needed to paper the sides?

SOLUTION:

Distance around the room	=	80 feet
Width of doors and windows	=	20 feet

After deducting for doors and windows 60 feet
$60 \div 7 = 8\frac{4}{7}$, or 9 double rolls.

CARPETING

Facts about Carpets·

(1) Carpets are usually ¾ yard wide and are sold by the linear yard.

(2) Always draw a diagram of the floor or stairs to be covered.

(3) The number of yards required depends on which way the strips run—whether lengthwise or across the room. Sometimes by running the strips lengthwise, there is less waste in matching the pattern.

(4) The part cut off in matching patterns is charged to the purchaser.

Rules for Estimating:

The number of yards required will be the number of yards in a strip (including the waste for matching), multiplied by the number of strips.

EXAMPLE: What is the cost of carpeting a room 16 feet by 24 feet at 85c per yard? The carpet is 2¼ feet wide and the strips run lengthwise.

SOLUTION:

$16 \div 2\frac{1}{4} = 7\frac{1}{9}$. Hence, I must buy 8 strips.
$24 \div 3 = 8$, which is the number of yards in a strip.
8×8 yards = 64 yards.
64 yards will cost 64 × 85c, or $54.40.

To this must be added the cost of sewing, the laying of the carpet, and the waste in matching the pattern.

LAND MEASURE

RULE.—To find the number of acres in a tract of land, divide the number of square rods by 160, or number of square chains by 10.

EXAMPLE: (1) How many square rods, also acres, in a field 80 rods long and 62½ rods wide?

$80 \times 62\frac{1}{2} = 5000$ square rods; $5000 \div 160 = 31\frac{1}{4}$ acres. *Ans.* 31¼ acres.

(2) In tract, 79 chains 84 links (79.84 chains) by 41 chains 25 links (41.25 chains)?

$79.84 \times 41.25 = 3293.4$ square chains; $3293.4 \div 10 = 329.34$ acres. *Ans.* 329.34 acres.

Table showing one side of a Square Tract or Lot containing

1	acre =	208.7 feet =	43,560 square feet
1½	acres =	255.6 feet =	65,340 square feet
2	acres =	295.2 feet =	87,120 square feet
2½	acres =	330 feet =	108,900 square feet
3	acres =	361.5 feet =	130,680 square feet
5	acres =	466.7 feet =	217,800 square feet
10	acres =	660 feet =	435,600 square feet
1/10	acre =	66 feet =	4,356 square feet
⅛	acre =	73.8 feet =	5,445 square feet
1/6	acre =	85.2 feet =	7,260 square feet
¼	acre =	104.4 feet =	10,890 square feet
⅓	acre =	120.5 feet =	14,520 square feet
½	acre =	147.6 feet =	21,780 square feet
¾	acre =	180.8 feet =	32,670 square feet

TABLE OF SURVEYORS' SQUARE MEASURE

272½ square feet = 1 square rod
16 square rods = 1 square chain
160 square rods, or 10 square chains = 1 acre
640 acres = 1 square mile, or section
36 square miles, or 36 sections = 1 township

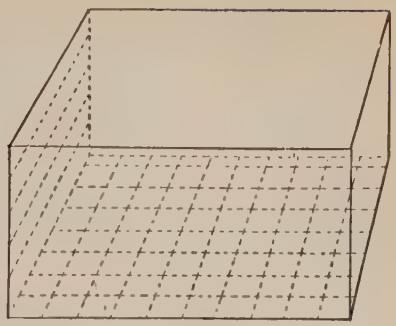
TEXAS LAND MEASURE

(Also used in Mexico, New Mexico, Arizona, and California)

26,000,000	square varas (square of 5,099	varas) =	1 league and 1 labor =	4,605.5 acres
1,000,000	square varas (square of 1,000	varas) =	1 labor =	177.136 acres
25,000,000	square varas (square of 5,000	varas) =	1 league =	4,428.4 acres
12,500,000	square varas (square of 3,535.5	varas) =	½ league =	2,214.2 acres
8,333,333	square varas (square of 2.886.7	varas) =	⅓ league =	1,476.13 acres
6,250,000	square varas (square of 2,500	varas) =	¼ league =	1,107.1 acres
7,225,600	square varas (square of 2,688	varas)	=	1,280 acres
3,612,800	square varas (square of 1,900.8	varas) =	1 section =	640 acres
1,806,400	square varas (square of 1,344	varas) =	½ section =	320 acres
903,200	square varas (square of 950.44	varas) =	¼ section =	160 acres
451,600	square varas (square of 672	varas) =	⅛ section =	80 acres
225,800	square varas (square of 475	varas) =	⅛ section =	40 acres
5,645.376	square varas (square of 75.137	varas) =	4,840 square yards =	1 acre

To find the number of acres in any number of square varas, multiply the latter by 177 (or to be more exact, by 177⅛), and cut off six decimals.

1 vara = 33⅓ inches 1,900.8 varas = 1 mile.



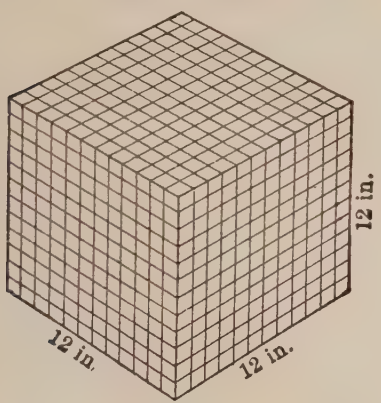
THE MEASURE OF SOLIDS, OR CUBIC MEASURE

Just as the rectangle is the chief surface considered in arithmetic, so the rectangular solid is the chief solid body.

A rectangular solid is bounded by six rectangular surfaces, each opposite pair of rectangles being equal and parallel to each other.

A rectangular solid thus has three dimensions —length, breadth, and thickness.

If the length, breadth, and thickness are all equal to one another, the solid is called a cube. Hence, a cubic foot, the unit of volume, is a solid body whose length, breadth, and thickness are each a linear foot. Similarly, a cubic inch measures one linear inch in length, breadth, and thickness; and a cubic yard measures one linear yard in length, breadth, and thickness.



One cubic foot

The number of cubic feet (or inches, or yards) in the volume of a rectangular solid is equal to the number of linear feet (or inches, or yards) in the length, multiplied by the number of linear feet (or inches, or yards) in the breadth, multiplied by the number of linear feet (or inches, or yards) in the thickness.

This is usually abbreviated into

Length × breadth × thickness = volume, or cubic content.

For, suppose the solid in the diagram is 10 feet in length, 8 feet in breadth, and 5 feet in thickness. It is clear that the solid can be cut into five slices, each 1 foot thick, by planes parallel to the bottom. But, the bottom contains 10×8 square feet and above each square foot there is a cubic foot. Thus, each slice contains 10×8 cubic feet. Therefore, since there are five slices, the whole solid contains 10×8×5, or 400 cubic feet.

Since length × breadth × thickness = cubic content, it follows that, if we know any three of these four quantities, we can find the fourth.

The student should remember that

(a) A cubic foot of water weighs 1000 ounces (avoirdupois) approximately.

(b) A gallon of pure water weighs 10 pounds (avoirdupois).

We have thus a relation between weight, capacity, and cubic content.

Table of Cubic Measure

1728 cubic inches (cu. in.) = 1 cubic foot (cu. ft.)
27 cubic feet = 1 cubic yard (cu. yd.)
128 cubic feet = 1 cord (C.)

Cubic Yard		Cubic Feet		Cubic Inches
1	=	27	=	46656

A *cord* of wood or stone is a pile 8 feet long, 4 feet wide, and 4 feet high.

A pile of wood 4 feet high, 4 feet wide and 1 foot long makes a *cord foot*. 8 cord feet = 1 cord.

A *perch* of stone or masonry is 16½ feet long, 1½ feet thick, and 1 foot high, and contains 24¾ cubic feet.

A *cubic yard* of earth is considered a *load*

Brick work is commonly estimated by the thousand bricks.

Bricklayers, masons, and joiners commonly make a deduction of one half the space occupied by windows and doors in the walls of buildings.

In computing the contents of walls, masons and bricklayers multiply the entire distance around on the outside of the wall by the height and thickness. The corners are thus measured twice.

A cubic foot of distilled water at the maximum density, at the level of the sea, and the barometer at 30 inches, weighs 62½ pounds or 1000 ounces avoirdupois.

By actual measurements. it has been found that a bushel, dry measure, contains about 1¼ cubic feet. This makes it easy to estimate about how many bushels any bin will hold.

Practical Applications of Cubic Measure

Example: An open tank made of iron ¼ inch thick, is 4 feet long, 2 feet 6 inches broad, and 2 feet deep, outside measurement. Assuming that iron weighs 7.8 times as much as water, find the weight of the tank.

The external volume of the tank = $2 \times 2\frac{1}{2} \times 4$ cubic feet = 20 cubic feet.

Since the iron is ¼ inch thick, the inside length is ½ inch less than the outside, the inside breadth is ½ inch less than the outside, and the inside depth is ¼ inch less than the outside.

Therefore the interior volume

$$= 29\tfrac{1}{2} \times 47\tfrac{1}{2} \times 23\tfrac{3}{4} \text{ cubic inches}$$

$$= \frac{59 \times 95 \times 95}{16} \text{ cubic inches}$$

$$= 33279\tfrac{1}{16} \text{ cubic inches}$$

Therefore, volume of iron in the tank
$= 20$ cubic feet $- 33279\frac{1}{6}$ cubic inches
$= 1280\frac{5}{6}$ cubic inches.

But 1 cubic foot of iron weighs as much as 7.8 cubic feet of water, *i. e.*, 7.8×1000 ounces, or 7800 ounces.

$$\therefore \text{Weight of tank} = \frac{1280\frac{5}{6} \times 7800}{1728 \times 16} \text{ pounds.}$$

$= 361.199$ pounds, *Ans.*

EXAMPLE: A wood pile is 8 feet high and 40 feet long. The sticks are 4 feet long. How many cords in it?

SOLUTION: Being 8 feet high, it is 2 cords high. 40 feet in length equal 5 cords in length. Hence, the pile contains 2×5 cords, or 10 cords.

To estimate a bin:

(1) Find the number of cubic feet in the bin.
(2) Divide the number of cubic feet by $1\frac{1}{4}$.
(3) The result is the number of bushels.

EXAMPLE: How many bushels will a bin hold, if its inside measurements are, length 20 feet, width 12 feet, depth 8 feet?

SOLUTION: The number of cubic feet in a bin is $8 \times 12 \times 20$, or 1920.

If 1 bushel contains $1\frac{1}{4}$ cubic feet, in 1920 cubic feet there are as many bushels as $1\frac{1}{4}$ is contained times in 1920, or 1536.

WORK:

$8 \times 12 \times 20 = 1920$
$1920 \div 1\frac{1}{4} = 1536.$

The work may be indicated in this way as well:—

$$8 \times 12 \times 20 \times \tfrac{4}{5} = 1536.$$

To get the number of heaped bushels of corn in the ear in a crib:

(1) Multiply the length of the crib in inches by the width in inches.
(2) Multiply the product obtained, by the height of the corn in the crib in inches.
(3) Divide the result by 2748.

EXAMPLE: How much corn in the ear can I put into a crib 12 feet wide, 20 feet long, and 10 feet deep?

SOLUTION: The number of cubic inches in the crib is $144 \times 240 \times 120$, or 4,147,200.

Since 2748 cubic inches hold 1 bushel, 4,147,200 cubic inches hold as many bushels as 2748 is contained times in 4,147,200, or 1509+ bushels.

WORK:

$$\frac{144 \times 240 \times 120}{2748} = 1509+.$$

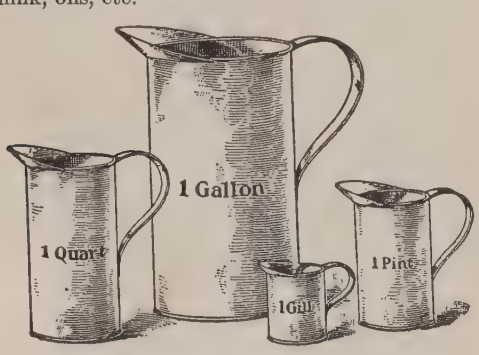
MEASURES OF CAPACITY

Measures used in telling the extent of room in vessels are called *measures of capacity*.

There are two kinds of capacity measures, dry measures and liquid measures.

Dry measures are used to measure grain, seeds, and the like.

Liquid measures are used to measure water, milk, oils, etc.



Liquid measures

COMMON LIQUID MEASURE TABLE

4 gills (gi.) = 1 pint (pt.)
2 pints = 1 quart (qt.)
4 quarts = 1 gallon (gal.)
$31\frac{1}{2}$ gallons = 1 barrel (bbl.)
2 barrels = 1 hogshead (hhd.)

Gallon		Quarts		Pints		Gills
1	=	4	=	8	=	32

A pint, quart, or gallon, dry measure, is more than the same quantity, liquid measure; for a quart, dry measure, is $\frac{1}{32}$ of a bushel, or $\frac{1}{32}$ of 2150.4 cubic inches, which is about $67\frac{1}{5}$ cubic inches, while a quart liquid measure is $\frac{1}{4}$ of 231 cubic inches, or $57\frac{3}{4}$ cubic inches.

	Cu. In. in 1 Gal.	Cu. In. in 1 Qt.	Cu. In. in 1 Pt.	Cu. In. in 1 Gi.
Liquid measure	231	$57\frac{3}{4}$	$28\frac{7}{8}$	$7\frac{1}{2}$
Dry measure	$268\frac{4}{5}$	$67\frac{1}{5}$	$33\frac{3}{5}$	$8\frac{2}{5}$

In determining the capacity of cisterns, reservoirs, etc., $31\frac{1}{2}$ gallons are considered a barrel (bbl.), and 2 barrels, or 63 gallons, a hogshead (hhd.). In commerce, however, the barrel and hogshead are not fixed measures.

Casks of large size, called tierces, pipes, butts, tuns, etc., do not hold any fixed quantity. Their capacity is usually marked upon them.

The standard gallon of the United States contains 231 cubic inches, and will hold a little over $8\frac{1}{3}$ pounds of distilled water. The imperial gallon, now adopted by Great Britain, contains 277.274 cubic inches, or 10 pounds of distilled water, temperature 62 degrees Fahrenheit, the barometer standing at 30 inches.

TABLE OF APOTHECARIES' LIQUID MEASURE

These measures are used in mixing medicines.

60 minims (m) = 1 fluid dram (ʒ)
8 fluid drams = 1 fluid ounce (ƒ℥)
16 fluid ounces = 1 pint (*O.*)
8 pints = 1 gallon (*Cong.*)

A minim is about 1 drop.

TABLE OF DRY MEASURE

2 pints (pt.) = 1 quart (qt.)
8 quarts = 1 peck (pk.)
4 pecks = 1 bushel (bu.)

Bushel		Pecks		Quarts		Pints
1	=	4	=	32	=	64

A common Winchester bushel (the standard of the United States) contains 2150.42 cubic inches.

A dry quart contains 67.2 cubic inches.

A liquid quart contains 57.75 cubic inches.

EXAMPLE 1: Reduce 5 bushels 2 pecks 4 quarts 1 pint to pints.

OPERATION:

4	8	2
bu.	pk.	qt. pts.
5	2	4 1
4		
22 pk.		
8		
180 qt.		
2		
361 pt.		

EXPLANATION: As there are 4 pecks in 1 bushel, any number of bushels is equal to 4 times that number of pecks. Then, 5 bushels = 20 pecks, and 2 pecks added make 22 pecks. As there are 8 quarts in 1 peck, any number of pecks is equal to 8 times that number of quarts. Then 22 pecks = 176 quarts, and 4 quarts added make 180 quarts. As there are 2 pints in 1 quart, any number of quarts is equal to 2 times that number of pints. Then, 180 quarts = 360 pints, and 1 pint added make 361 pints. Hence 5 bushels 2 pecks 4 quarts 1 pint = 361 pints.

EXAMPLE 2: Reduce 361 pints to bushels.

OPERATION:

2	361 pt.
8	180 qt. + 1 pt.
4	22 pk. + 4 qt.
	5 bu. + 2 pk.

EXPLANATION: As there are 2 pints in 1 quart, 361 pints are equal to one-half that number of quarts = 180 quarts, with a remainder of 1 pint. Also, 180 quarts are equal to one-eighth of that number of pecks = 22 pecks, with a remainder of 4 quarts. Finally, 22 pecks are equal to one-fourth of that number of bushels = 5 bushels, with a remainder of 2 pecks. Hence, 361 pints are equal to 5 bushels 2 pecks 4 quarts 1 pint.

MEASURES OF WEIGHT

AVOIRDUPOIS WEIGHT

Avoirdupois Weight is used for weighing heavy articles as grain, groceries, coarse metals, etc.

16 ounces (oz.) = 1 pound (lb.)
100 pounds = 1 hundredweight (cwt.)
20 hundredweight = 1 ton (T.)

Ton	Hundred-weight	Pounds	Ounces
1	= 20	= 2000	= 32000

Scale.—20, 100, 16.

In weighing coal at the mines and in levying duties at the United States Custom House, the long ton of 2240 pounds is sometimes used.

The ounce is considered as 16 drams.

The unit is the pound. It contains 7000 grains.

The following denominations are also used:

14 pounds	= 1 stone
100 pounds butter	= 1 firkin
100 pound grain or flour	= 1 cental
100 pounds dried fish	= 1 quintal
100 pounds nails	= 1 keg
196 pounds flour	= 1 barrel
200 pounds pork or beef	= 1 barrel
280 pounds salt at N. Y. works	= 1 barrel

Troy Weight

Troy Weight is used in weighing gold, silver, and jewels.

TABLE

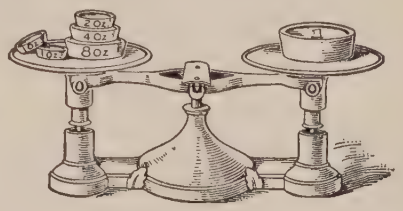
24 grains (gr.)	= 1 pennyweight (pwt.)
20 pennyweights	= 1 ounce (oz.)
12 ounces	= 1 pound (lb.)

Pounds	Ounces	Penny-weights	Grains
1	= 12	= 240	= 5760

In weighing diamonds, pearls, and other jewels, the unit commonly employed is the *carat*, which is equal to 4 carat grains, or 3.168 Troy grains.

The term *carat* is also used to express the fineness of gold, and means $\frac{1}{24}$ part. Thus, gold that is 18 carats fine is $\frac{18}{24}$ gold, and $\frac{6}{24}$ alloy.

The *standard unit* of weight is the *Troy pound*. It is equal to the weight of 22.7944 cubic inches of distilled water at its maximum density, the barometer being at 30 inches. It is identical with the Troy pound of Great Britain.



The following are approximate avoirdupois weights of certain articles of produce according to the laws of the United States, and in the majority of States:

* Not defined.
a Small white beans, 60 pounds.
b Green apples.
c Sugar beets and mango-wurzels.
d Shelled beans, 60 pounds; velvet beans, 78 pounds.
e White beans.
f Wheat bran.
g Corn in ear, 70 pounds until December 1st next after growth; 68 pounds thereafter.
h English blue-grass seed, 22 pounds; native blue-grass seed, 14 pounds.
i Rice corn.
j Corn in ear from November 1st to May 1st following, 70 pounds; 68 pounds from May 1st to November 1st.
k Soy beans, 58 pounds.
l Cracked corn, 50 pounds.
m Green unshelled beans, 30 pounds.
n Cannel coal, 70 pounds.
o Standard weight in borough of Greensburg, 75 pounds.
p Dried beans; gree n unshelled beans, 30 pounds.
q Red and white.
r Unwashed plastering hair, 8 pounds; washed plastering hair, 4 pounds.

Table II. LEGAL WEIGHTS PER BUSHEL FIXED IN BUT ONE OR TWO STATES

Article	Weight	States	Article	Weight	States
	Pounds			Pounds	
Blackberries	30	Iowa. Tennessee, 48 pounds; dried, 28 pounds.	Kale	30	Tennessee.
Blueberries	42	Minnesota.	Land plaster	100	Tennessee.
Canary seed	60	Tennessee.	Mustard	30	Tennessee.
Cantaloupe melon	50	Tennessee.	Plums	40	Florida. Tennessee, 64 pounds.
Cement	80	Tennessee.	Plums, dried	28	Michigan.
Cherries	40	Iowa. Tennessee, with stems 56 pounds; without stems, 64 pounds.	Popcorn	70	Iowa, Indiana, Tennessee, Ohio, in the ear, 42 pounds; Iowa, shelled, 56 pounds.
Chestnuts	50	Tennessee. Virginia, 57 pounds.	Prunes, dried	28	Idaho; green, 45 pounds.
Cotton seed, staple	42	South Carolina.	Quinces	48	Florida, Iowa and Tennessee.
Cucumbers	48	Iowa, Tennessee, Missouri, Wisconsin, 50 pounds.	Rape seed	50	Wisconsin.
Currants	40	Iowa and Minnesota.	Raspberries	32	Iowa, Kansas. Tennessee, 48 pounds.
Grapes	40	Iowa. Tennessee, with stems, 48 pounds; without stems, 60 pounds.	Rhubarb	50	Tennessee.
			Salads	30	Tennessee.
			Sand	130	Iowa.
			Spinach	30	Tennessee.
Hickory nuts	50	Tennessee.	Strawberries	32	Iowa. Tennessee, 48 pounds.
Hominy	60	Ohio. Tennessee, 62 pounds.	Sugar-cane seed	57	New Jersey.
Horse-radish	50	Tennessee.	Velvet-grass seed	7	Tennessee.
Kaffir corn	56	Kansas.	Walnuts	50	Tennessee, Iowa.

Apothecaries' Weight

Apothecaries' Weight is used by apothecaries and physicians weighing medicines for prescriptions.

TABLE

20 grains (gr.)	= 1 scruple (sc., or ℈)
2 scruples	= 1 dram (dr., or ʒ)
8 drams	= 1 ounce (oz., or ℥)
12 ounces	= 1 pound (lb., or ℔)

Pound	Ounces	Drams	Scruples	Grains
1	= 12	= 96	= 288	= 5760

1. In writing prescriptions, physicians express the number in Roman characters, using j instead of i final. They also write the symbol first; thus: ℨv, ℨvj, ℈ij.

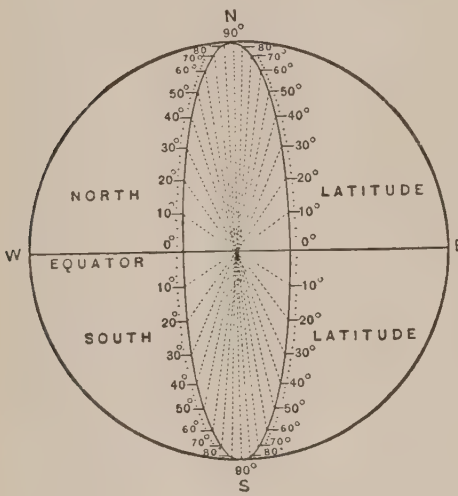
Medical Signs and Abbreviations

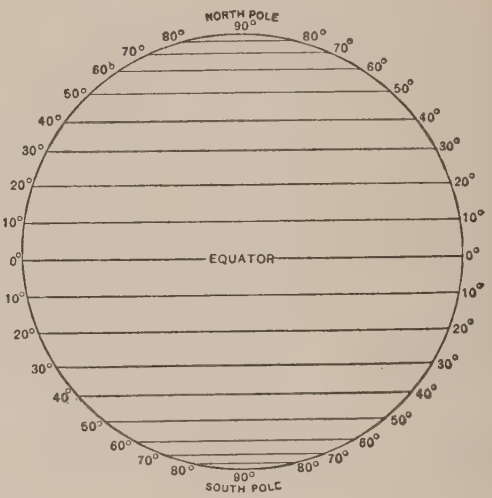
℞ (Lat. Recipe), take; āā, of each; ℔, pound; ℥, ounce; ʒ, drachm; ℈, scruple; ♏, minim, or drop; O or o, pint; f ʒ, fluid ounce; f ℥, fluid drachm; as, ℥ss, half an ounce; ℨi, one ounce; ℨ iss, one ounce and a half; ℨij, two ounces; gr. grain; Q. S., as much as sufficient; Ft. Mist., let a mixture be made; Ft. Haust., let a draught be made; Ad., add to; Ad lib., at pleasure; Aq., water; M., mix; Mac., macerate; Pulv., powder; Pil., pill; Solv., dissolve, St., let it stand; Sum. to be taken; D., dose; Dil., dilute; Filt., filter; Lot., a wash; Garg., a gargle; Hor. Decub., at bed time; Inject., injection; Gtt., drops; ss, one-half; Ess., essence.

Comparison of Weights

TABLE

1 pound avoirdupois	=	7000 grains
1 ounce avoirdupois	=	437½ grains
1 pound Troy, or apothecary	=	5760 grains
1 ounce Troy, or apothecary	=	480 grains





CIRCULAR MEASURES

Circular or Angular Measures are used in surveying, navigation, astronomy, geography, reckoning latitude and longitude, and computing differences in time.

A *Circle* is a plane figure bounded by a curved line, every point of which is equally distant from a point within, called the center.

The *Circumference* is the bounding line of a circle.

The *Radius* of a circle is a straight line drawn from the circumference to the center.

The *Diameter* is a straight line drawn through the center, with the ends terminating in the circumference.

An *Arc* of a circle is any portion of the circumference.

An *Angle* is the difference in direction between two straight lines which meet.

If two diameters divide a circle into four equal parts, these diameters make *right angles* with each other.

An angle less than a right angle is an *acute angle.*

The circumference of a circle may be divided into 360 equal parts, called *degrees.* If the circle is large, the degree is large, and if the circle is small, the degree is small, but the degree is always $^1/_{360}$ part of the circumference, whatever the size of the circle.

An angle at the center of a circle is measured by the arc which bounds it.

If the angle is a right angle, it is measured by ¼ of 360 degrees, or 90 degrees; hence, any angle of 90 degrees is a right angle.

An acute angle is always less than 90 degrees.

An obtuse angle is always more than 90 degrees.

Table of Circular Measure

60 seconds (″) = 1 minute (′)
60 minutes = 1 degree (°)
360 degrees = 1 circumference (cir.)

Circumference	Degrees	Minutes	Seconds
1	= 360	= 21,600	= 1,296,000

A *quadrant* is ¼ of a circumference, or 90°; a *sextant* is $^1/_6$ of a circumference, or 60°.

The length of a degree of longitude on the earth's surface at the Equator is 69.16 miles.

In astronomical calculation 30° are called a *sign*, and there are therefore 12 signs in a circle.

LONGITUDE AND TIME

The earth's circumference (which has the form of a circle) at the equator is (3.1416×7926), 24900 miles; which divided by 360, gives 69.17 miles for 1 degree of longitude at the equator. Leaving the equator, degrees of longitude gradually diminish, since all meridians converge at the poles. Thus, 1 degree of longitude, at 10 degrees of latitude, is 68.1 miles; at 20 degrees 65 miles; at 30 degrees 59.9 miles; at 40 degrees 53 miles; at 50 degrees 44.5 miles; at 60 degrees 34.6 miles; at 70 degrees 23.7 miles; at 80 degrees 12 miles; at 90 degrees 0.

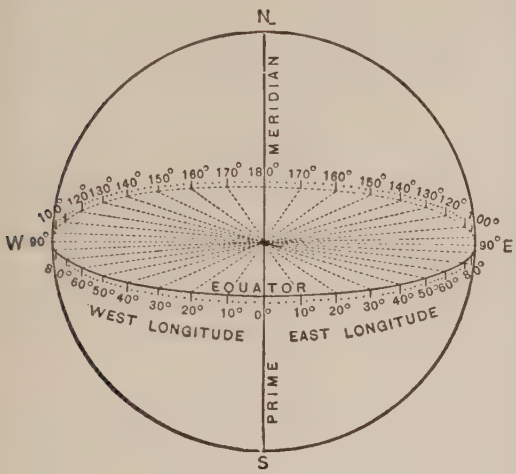
Imaginary lines running north and south, through these degrees, from pole to pole, are called *meridians.* Those east and west, *parallels.*

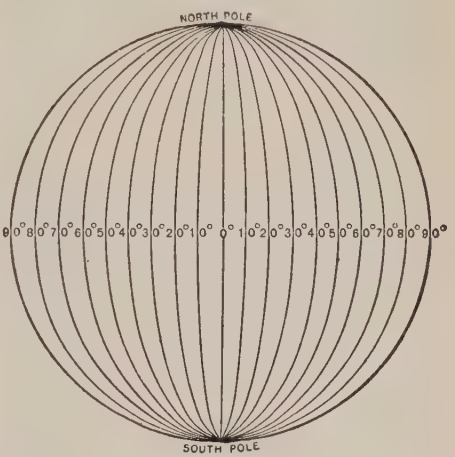
One meridian which runs through Greenwich, near London, England, is called the *prime meridian*, and all the other meridians are reckoned as east or west of it.

Longitude is distance east or west of the prime meridian. When we say that the longitude of

Paris is 2° 20′ East, we mean that the merdian running through Paris is 2° 20′ east of the prime meridian that runs through Greenwich, England. The longitude of Washington, D. C., is 77° 7′ West. That means that the meridian which passes through Washington is 77° 7′ west of the prime meridian.

The longitude of a place tells in degrees, minutes, and seconds, the distance it is east or west of the prime meridian.





RULE.—*To find the difference of time between two places, when the difference of longitude is known, or vice versa, multiply the given longitude, expressed in degrees, by 4. This gives the equivalent time in minutes. Dividing the given time, expressed in minutes, by 4, gives the equivalent longitude in degrees.*

EXAMPLE: The difference of longitude between Boston and San Francisco is nearly 51¼°, what is the difference of time?

51¼×4=205. 205 minutes equal 3 hours and 25 minutes. *Ans.* 3 hours and 25 minutes.

The difference of time between London and New York is about 4 hours and 55½ minutes, what is the difference of longitude?

4 hours and 55½ minutes equals 295½ minutes. 295½÷4=73⅞. *Ans.* 73⅞°.

MEASURES OF TIME

The unit of time measurement is the same among all nations. Practically it is 1-86400 of the mean solar day, but really it is a perfectly arbitrary unit, as the length of the mean solar day is not constant for any two periods of time. There is no constant natural unit of time.

Time measures are used in telling the time of day, in problems in longitude and time, in figuring interest on notes and bills, and in numerous other ways.

TABLE OF THE DIVISIONS OF TIME

60 seconds (sec.)	= 1 minute (min)
60 minutes	= 1 hour (hr.)
24 hours	= 1 day (da.)
7 days	= 1 week (wk.)
30 days	= 1 commercial month (mo.)
52 weeks	= 1 year (yr.)
12 months	= 1 year
360 days	= 1 commercial year
365 days	= 1 common year
366 days	= 1 leap year
100 years	= 1 century

Century	Years	Months	Days	Hours	Minutes
1	= 100	= 1,200	= 36,500	= 876,000	= 52,560,000

Centennial years exactly divisible by 400, and other years exactly divisible by 4, are *Leap Years.*

WHY WE HAVE LEAP YEAR

The average time it takes the earth to revolve once around the sun (*one* year) is 365 days, 5 hours, 48 minutes, 47.8 seconds, or *about* 365¼ days.

The change in the length of the mean sidereal day, *i. e.*, of the time of the earth's rotation upon its axis, amounts to 0.01252 seconds in 2400 mean solar years.

Instead of reckoning this part of a day each year, it is disregarded, and an addition is made when this amounts to one day, which is very nearly every fourth year. This addition of one day is made to the month of February. Since the part of a day that is disregarded when 365 days are considered as a year, is a little less than one quarter of a day, the addition of one day every fourth year is a little too much, and, to correct this excess, addition is made to only every fourth centennial year.

STANDARD TIME

By this is meant time which differs from Greenwich mean time by whole hours.

The earth revolves on its axis from west to east, nearly 17.3 miles in 1 minute at the equator; at the latitude of New Orleans, nearly 15 miles in 1 minute; at Memphis, 14 miles; at Chicago, 13 miles; at London, 10.8 miles; at St. Petersburg, 8.6 miles. That is, a watch would gain one minute going west, or lose one minute going east that distance, in the latitudes of the respective cities.

The globe is divided into zones of 15 degrees or one hour breadth, the Greenwich meridian being in the center of the zero zone. Thus Belgium and Holland (since 1892) keep Greenwich time; Denmark, Sweden, Switzerland (1894), Austrian railroads, Germany, and Italy (1893) keep the time of longitude 15 degrees East—*i.e.* one hour earlier than Greenwich. In North America again five zones are distinguished. The corresponding times are distinguished as Eastern (67½ to 82½ degrees), Central (82½ to 97½ degrees), Mountain (97½ to 112½ degrees), and Pacific (112½ to 127½ degrees) times.

New York people are in the Eastern Time Belt. If they rise at six o'clock in the morning,

The clock at Greenwich, near London, England, from which the standard time of the world is reckoned.

they will be up a whole hour before Chicago people, who get up at the same hour.

Thus, each day begins an hour sooner in New York than in Chicago, two hours before Denver, and three hours before San Francisco.

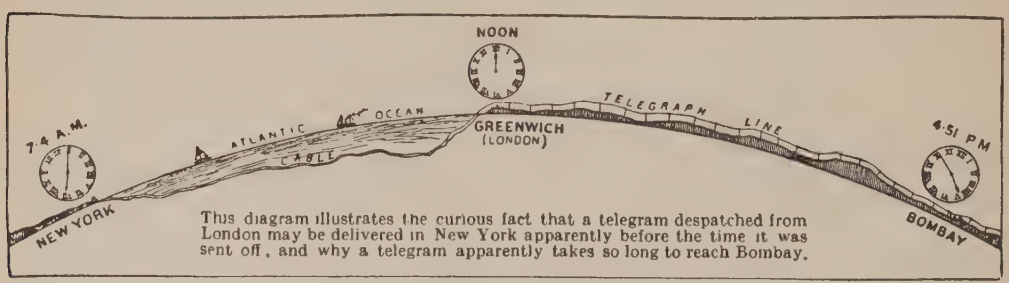
Standard time in Japan is nine hours earlier than Greenwich time.

In the western parts of Canada the twenty-four hour system has been adopted, under which four P. M. becomes sixteen o'clock and so on. Steps are being taken to introduce it generally in India, Belgium, and the United States. It is of special convenience in the construction of railroad time tables; and it has long been used by the Italians and by astronomers.

THE CALENDAR

The reckoning of time among the ancients was very inaccurate. This was owning to their ignorance of astronomy, and also to changes that were made from time to time for political reasons. The calendar was reformed by Julius Cæsar, 46 B. C., who made the year consist of 365¼ days, adding one day every fourth year. In 1582, the error in the calendar established by him had increased to 10 days; that is, too much time had been reckoned as a year, until the civil year was 10 days behind the solar year. To correct this error, Pope Gregory XIII. decreed that 10 days should be stricken from the calendar, that the day following the 3d day of October, 1582, should be made the 14th, and that henceforth only those centennial years should be leap years which are divisible by 400.

Most Catholic countries adopted the Gregorian Calendar soon after it was established. Great Britain did not adopt it until 1752, when the error amounted to 11 days. By Act of Parliament, the 3d of September was called the



NOON

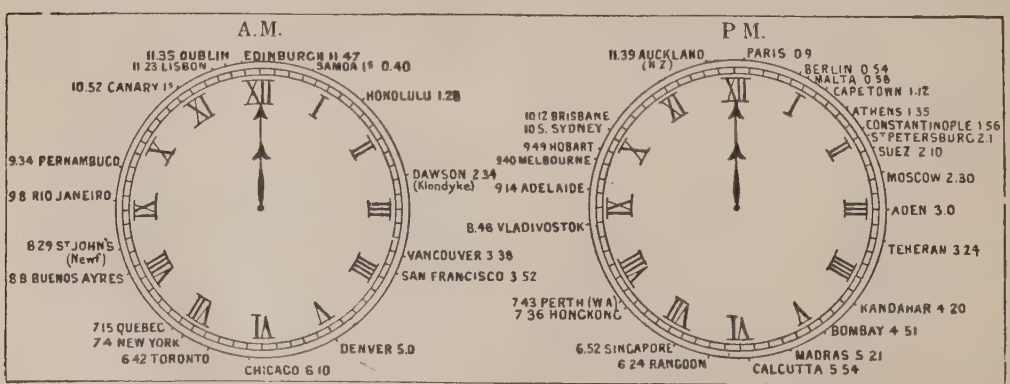
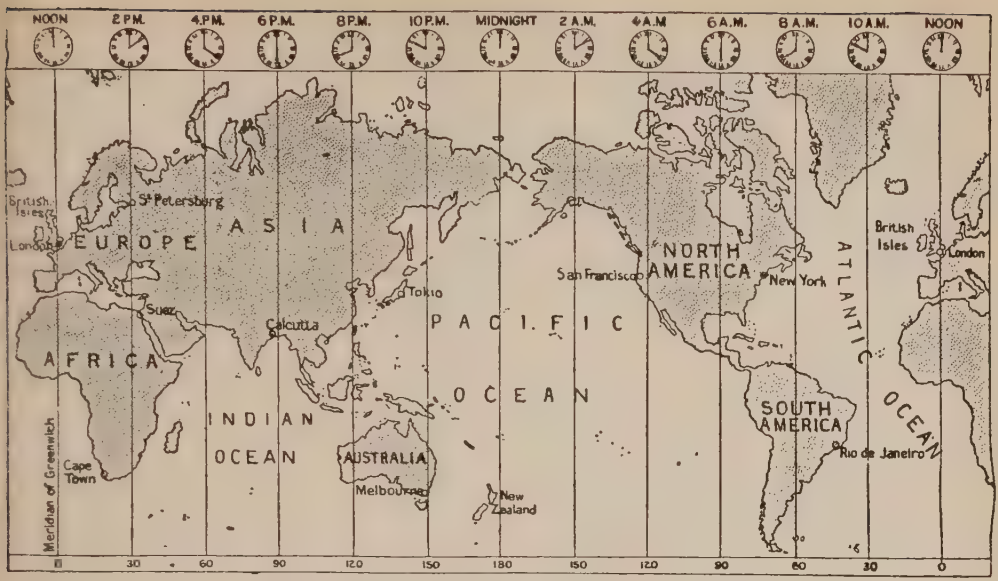
GREENWICH (LONDON)
TELEGRAPH LINE
NEW YORK
BOMBAY
This diagram illustrates the curious fact that a telegram despatched from London may be delivered in New York apparently before the time it was sent off, and why a telegram apparently takes so long to reach Bombay.

SIMULTANEOUS TIME IN LONDON, NEW YORK, AND BOMBAY



COMPARATIVE TIME ALL OVER THE WORLD WHEN NOON AT GREENWICH



THE COMPARATIVE TIME ZONES OF THE WORLD

14th. The civil year by the same act was made to commence on the 1st of January, instead of the 25th of March, as was previously the case.

Dates reckoned by the Julian calendar are called Old Style (O.S.), and those reckoned by the Gregorian calendar are called New Style (N.S.). The difference now amounts to 12 days.

Perpetual Calendar

To find the day of the week for any given date.

1. Take the last two figures of the year, add one-fourth of them (neglecting remainder). Thus: $1949 = 49 + 12 = 61$.

2. Add for the month, if for January or October, 1; May, 2; August, 3; February, March, or November, 4; June, 5; September or December, 6; April or July, 0; if leap year (that is, if it be divisible by 4 without remainder) January 0; February 3.

3. Add day of month.

Divide the sum of these three by 7, and remainder gives the number of the day of the week.

Thus:—What day of the week is 15th July, 1908?

1. $8 + 2 = 10$
2. July $= 0$
3. 15th $= 15$

$$25 = 7 \times 3 + 4$$

4th day of the week = Wednesday.

What day of the week was December 25th, 1905?

1. $5 + 1 = 6$
2. Dec. $= 6$
3. 25th $= 25$

$$37 = 7 \times 5 + 2$$

2nd day of the week = Monday.

The above only applies to 20th Century. For 19th Century, add 2; for 21st Century, add 6; 18th Century, 4; but before 1752 the "old style" was used.

WHERE THE DAY BEGINS

The day begins earlier as you go east until you meet the 180th meridian. This is where the day begins. Starting here, it travels westward, giving the whole world a new day. The 180th meridian is called the *International Date Line* (*I. D. L.*) but in reality, the date line is a crooked line which zigzags across the 180th meridian.

From the time the day starts at the International Date Line, until the sun again reaches that line, the same day is in progress the world over.

As marked now, the International Date Line passes southward through Behring Sea, then westerly, then returns to the 180th meridian at about 40 degrees north. It then follows the 180th meridian to 10 degrees south, where it swerves east but returns again to the 180th meridian at about 50 degrees south. It then follows that meridian.

TIME ON SHIPBOARD.—The twenty-four hours are divided on board ship into seven parts, and the crew is divided into two parts or watches, designated port and starboard watches. Each watch is on duty four hours, except from four to eight p. m., which time is divided into two watches of two hours each, called dog watches, by means of which the watches are changed every day, and each watch gets a term of eight hours' rest at night. First watch, eight p. m. to midnight; middle watch, midnight to four a. m.; morning watch, four to eight a. m.; forenoon watch, eight a. m. to noon; afternoon watch, noon to four p. m.; first dog watch, four to six p. m.; second dog watch, six to eight p. m. The bell is struck every half-hour to indicate the time, as follows:

1 bell.....12:30 A.M.	1 bell.....12:30 P.M.
2 bells..... 1:00 A.M.	2 bells..... 1:00 P.M.
3 bells..... 1:30 A.M.	3 bells..... 1:30 P.M.
4 bells..... 2:00 A.M.	4 bells..... 2:00 P.M.
5 bells..... 2:30 A.M.	5 bells..... 2:30 P.M.
6 bells..... 3:00 A.M.	6 bells..... 3:00 P.M.
7 bells..... 3:30 A.M.	7 bells..... 3:30 P.M.
8 bells..... 4:00 A.M.	8 bells..... 4:00 P.M.
1 bell..... 4:30 A.M.	1 bell..... 4:30 P.M.

5 bells.....10:30 A.M.	5 bells.....10:30 P.M.
6 bells.....11:00 A.M.	6 bells.....11:00 P.M.
7 bells.....11:30 A.M.	7 bells.....11:30 P.M.
8 bells.....12:00 noon	8 bells.....12:00 night

HOW THE MONTHS GOT THEIR NAMES

January, from Janus, was the sacred month of the year to the Romans. To them, Janus was the god of the year. During the 18th century, the Europeans started to recognize it as the first month, but previous to this, March was considered the first.

February comes from februa, the name of a Roman festival celebrated on the 15th of the second month.

March is from Mars, the god of war. March was the first month of the year to the Romans.

April, from the Latin *aperire*, "to open," was probably so called because during this month buds begin to open.

May is from Maia, the mother of Mercury. The Romans offered sacrifices to this goddess on the first day of May.

The sixth month in our calendar, June, got its name from Juno, the wife of Jupiter.

July was so named in honor of Julius Cæsar, who was born in this month.

Emperor Augustus Cæsar commanded that the eighth month be named August after him.

September is from the Latin septem, meaning seven. At the time when March was the first month of the year, September was the seventh.

October, November, and December were originally the eighth, ninth and tenth months. *Octo*, *novem*, and *decem* are Latin numerals for eighth, ninth, and tenth.

HOW THE DAYS GOT THEIR NAMES

Sunday (that is, day of the sun, like Monday day of the moon), the first day of the week, the Lord's day, was sacred to Sol or the Sun.

Monday (that is, moon-day; Anglo-Saxon, *Monandæg*; German, *Montag*), the second day of our week, was formerly sacred to the moon.

Tuesday, the third day of the week, is so called from *Tiwesdæg*, the day of Tiw or Tiu, the old Saxon name for the god of war. The day bears a corresponding name in the other Germanic dialects.

Wednesday, the fourth day of the week, the *Dies Mercurii* of the Romans, the *Mittwoch* of the modern Germans. The name Wednesday is derived from the Northern mythology, and signifies Woden's or Odin's day. The Anglo-Saxon form was *Wôdanesday*, the Old German *Woutanestac*. The Swedish and Danish is *Onsdag*.

Thursday, (Swedish *Thorsdag*, German *Donnerstag*), the fifth day of the week, is so called from Donar, or Thor (see Dictionary of Myths), who, as god of the air, had much in common with the Roman Jupiter, to whom the same day was dedicated. (Latin *Jovis dies*, French *Jeudi*).

Friday, the sixth day of the week, from the Anglo-Saxon *Frige-dæg*, is the day sacred to *Frigga* or to *Freya*, the Saxon Venus.

Saturday (Anglo-Saxon *Sœterdæg*, *Sœterndæg*—*Sœter*, *Sœtern*, for Saturn, and *dæg*, a day—the day presided over by the planet Saturn), is the seventh or last day of the week; the day of the Jewish Sabbath.

MEASURES OF VALUE

The common measure of value is *Money*.

It is also called Currency, and is of two kinds, viz.: coin and paper money.

Stamped pieces of metal having a value fixed by law are *Coin or Specie*.

Notes and bills issued by the government and banks, and authorized to be used as money, are *Paper Money*.

All moneys which, if offered, legally satisfy a debt are a *Legal Tender*.

UNITED STATES MONEY

The unit of United States or Federal money is the Dollar.

The dollar mark is probably a combination of U. S., the initials of the words "United States."

The standard of United States money is the gold dollar. Gold is used because in itself it has great worth and little bulk, and because it varies very little in value.

NAMES OF UNITED STATES COINS

Bronze:		*Nickel:*	
One-cent piece		Five-cent piece	
Silver:		*Gold:*	
Dollar	=$1.00	Double eagle	=$20.00
Half-dollar	= 0.50	Eagle	= 10.00
Quarter-dollar	= 0.25	Half eagle	= 5.00
Dime	= 0.10	Quarter eagle	= 2.50

It may be interesting to know that the word *dollar* is supposed to have come from *Dale*, the name of a small town where dollars were first coined.

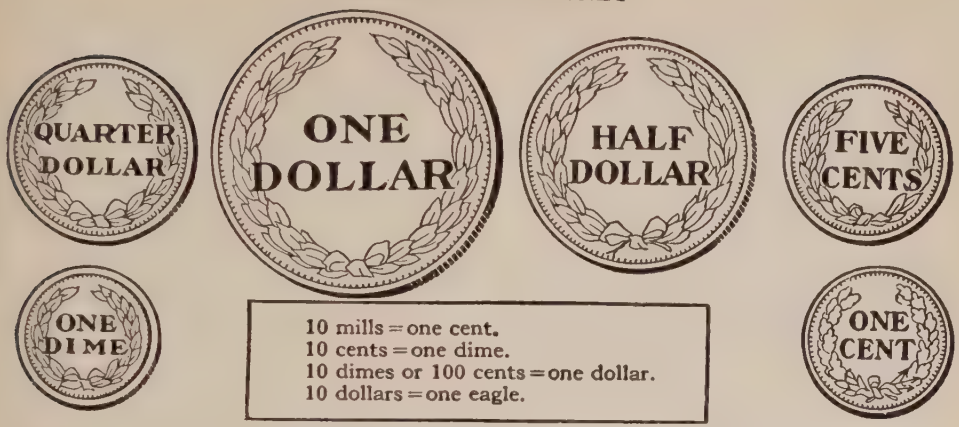
Dime is from the French word *disme*, which means tenth.

Cent comes from the Latin word *centum*, meaning hundred.

Mill is also from the Latin, coming from *mille*, a thousand.

Eagles were named after our national bird.

UNITED STATES MONEY



10 mills = one cent.
10 cents = one dime.
10 dimes or 100 cents = one dollar.
10 dollars = one eagle.

Weights of the United States Coins
And the Amounts for Which They are Legal Tender

GOLD

Denominations	Weight Grains	Amount for Which a Legal Tender
Double eagle, $20	516.	Gold coins of denomination are legal tenders for any amount.
Eagle, $10	258.	
Half eagle, $5	129.	
Three dollars	77.4	
Quarter eagle, $2.50	64.5	
Dollars	25.8	

SILVER

Denominations	Weight Grains	Amount for Which a Legal Tender
Standard dollar	412.5	Unlimited.
Trade Dollar	420.	Demonetized—Not a legal tender.
Half dollars	192.9	Ten dollars.
Quarter dollars	96.45	Ten dollars.
Twenty-cent pieces	77.16	Five dollars.
Dimes	38.58	Ten dollars.
Half-dimes	19.29	Five dollars.
Three-cent pieces	11.52	Five dollars.

MINOR COINS

Denominations	Weight Grains	Amount for Which a Legal Tender
Five cents	77.6	Twenty-five cents.
Three cents	30.	Twenty-five cents.
Two cents	96.	Twenty-five cents.
Cents	48.	Twenty-five cents.

Besides the coins there is paper money, founded on credit. It represents value, but in itself has no value.

This paper money is made up of paper promises to pay the amounts named, in gold or silver, on demand.

It includes bank bills, United States treasury notes, government bonds, etc. They represent the values $1, $2, $5, $10, $20, $50, $100, $500, $1,000 and $10,000.

Notation of United States Money

Dollars and cents are written together. Thus, two dollars and sixteen cents is written, $2.16.

The dollars are separated from the cents by a period. If the number of cents is less than ten, the tens' place is filled by a 0. Thus, we write twenty dollars and two cents, $20.02.

Mills, or tenths of a cent, are written to the right of the cents. Five dollars, six cents, four mills is written, $5.064.

Note.—The rules and processes of decimals apply to the addition, subtraction, multiplication, and division of United States money.

ENGLISH OR STERLING MONEY

Sterling Money is currency of Great Britain and Ireland.

Table of Sterling Money

4 farthings (far.)	= 1 penny (d.)
12 pence (not pennies)	= 1 shilling (s.)
20 shillings	= 1 pound (£), or sovereign
5 shillings	= 1 crown
21 shillings	= 1 guinea

The standard unit of Sterling Money is 1 pound or sovereign, whose value in our money is $4.8665.

The coins of Great Britain in general use are :—

Gold: Sovereign, half-sovereign, and guinea, which is equal to 21 shillings.

Silver: The crown (equal to 5 shillings), half-crown, florin (equal to 2 shillings), shilling, six-penny and three-penny pieces.

Copper: Penny and half-penny.

Example: I have £5 sterling. What is the value in United States money?

Solution:
The value is 5 × $4.8665, or $24.33.

FRENCH MONEY

In France the currency is decimal. The unit is the *Franc*.

TABLE

10 centimes (ct.) [pronounced *son-teems*]	= 1 decime (dc.)
10 decimes [pronounced *des-seems*]	= 1 franc (fr.)

Scale.—Decimal

The value of the franc, as determined by the Secretary of the Treasury, is $.193 in United States money.

The coins of France are of gold, silver, bronze, and copper. The gold coins are the *hundred, forty, twenty, ten,* and *five* franc pieces; the silver coins are the *five, two,* and *one* franc pieces; also the *fifty* and *twenty-five* centime pieces. The bronze coins are the *ten, five, two,* and *one* centime pieces. There are also copper coins in *ten* and *five* centime pieces.

Example: When in France, I bought goods as follows:—

3 books at 2 francs,
½ dozen pipes at 1 franc,
2 pictures at 4 francs.

What was the cost in United States money?

WORK:

3 books at 2 francs cost.....6 francs
½ dozen pipes at 1 franc cost....6 francs
2 pictures at 4 francs cost.....8 francs

Cost of all.....20 francs
20 francs = 20 × 19.3 cents, or $3.86

GERMAN MONEY

German money is legal currency of the German Empire.

TABLE

100 pfennigs = 1 mark

Scale.—Decimal

1. The unit is the *mark*. Its value is $.2385 in United States money.

2. The coins of the German Empire are of gold, silver, nickel, and copper. The gold coins are the 20-mark piece, the 10-mark piece, and the 5-mark piece. The silver coins are the *two* and *one* mark pieces; the nickel coins are the *ten* and *five* pfennig pieces; and the copper coins are the *two* and *one* pfennig pieces.

PHILIPPINES WEIGHTS AND MEASURES

1 pulgada (12 linea)	=	.927 inch
1 pie	=	11.125 inches
1 vara	=	33.375 inches
1 gantah	=	.8796 gallon
1 caban	=	21.991 gallons
1 libra (16 onzo)	=	1.0144 pounds average
1 arroba	=	25.360 pounds average
1 catty (16 tael)	=	1.394 pounds average
1 pecul (100 catty)	=	139.482 pounds average

PAPER MEASURE

24 sheets = 1 quire (qr.)
20 quires = 1 ream (rm.)
2 reams = 1 bundle
5 bundles = 1 bale

Although a ream contains 480 sheets, 500 sheets are usually sold as a ream.

NUMBER TABLE

12 units = 1 dozen
12 dozen = 1 gross
12 gross = 1 great gross
20 units = 1 score

PERCENTAGE AND ITS BUSINESS APPLICATIONS

The expression "per cent," which is an abbreviation of the Latin words "per centum," means "for each hundred."

The symbol % is often used to denote "per cent." Thus, 7 per cent, or 7%, means 7 parts out of every 100 parts, *i. e.*, $^7/_{100}$ of the whole.

Since per cent means hundredths, we may write any fraction whose denominator is 100 as so many per cent. In some cases the corresponding common fractions are so simple that it is advisable to remember them. For example:

$$25\% = \frac{25}{100} = \frac{1}{4}, \qquad 50\% = \frac{50}{100} = \frac{1}{2},$$

$$75\% = \frac{75}{100} = \frac{3}{4}, \qquad 33\frac{1}{3}\% = \frac{33\frac{1}{3}}{100} = \frac{1}{3},$$

$$66\frac{2}{3}\% = \frac{66\frac{2}{3}}{100} = \frac{2}{3}, \qquad 5\% = \frac{5}{100} = \frac{1}{20},$$

$$2\frac{1}{2}\% = \frac{2\frac{1}{2}}{100} = \frac{1}{40}, \qquad 12\frac{1}{2}\% = \frac{12\frac{1}{2}}{100} = \frac{1}{8},$$

and so on.

The *number* per cent is called the *rate* per cent.

TABLE OF ADDITIONAL VALUES

SYMBOL	DECIMAL	COMMON FRACTION
1% =	.01 =	$^1/_{100}$
2% =	.02 =	$^2/_{100}$ = $^1/_{50}$
3% =	.03 =	$^3/_{100}$
4% =	.04 =	$^4/_{100}$ = $^1/_{25}$
5% =	.05 =	$^5/_{100}$ = $^1/_{20}$
6% =	.06 =	$^6/_{100}$ = $^3/_{50}$
7% =	.07 =	$^7/_{100}$
8% =	.08 =	$^8/_{100}$ = $^2/_{25}$
9% =	.09 =	$^9/_{100}$
10% =	.10 =	$^{10}/_{100}$ = $^1/_{10}$
20% =	.20 =	$^{20}/_{100}$ = $^1/_5$
25% =	.25 =	$^{25}/_{100}$ = $^1/_4$
50% =	.50 =	$^{50}/_{100}$ = $^1/_2$
100% =	1.00 =	$^{100}/_{100}$ = 1

Here are a few others that should be learned:—

$6\frac{1}{4}\% = \frac{1}{16}$ of 100% $16\frac{2}{3}\% = \frac{1}{6}$ of 100%
$8\frac{1}{3}\% = \frac{1}{12}$ of 100% $33\frac{1}{3}\% = \frac{1}{3}$ of 100%
$12\frac{1}{2}\% = \frac{1}{8}$ of 100% $66\frac{2}{3}\% = \frac{2}{3}$ of 100%

A DECIMAL AS PER CENT

Write the decimal as hundredths, and the number expressing the number of hundredths is the per cent.

EXAMPLES:

$$.4 = .40 = \frac{40}{100} = 40\%$$

$$.8 = .80 = \frac{80}{100} = 80\%$$

$$.25 = \frac{25}{100} = 25\%$$

$$.33\frac{1}{3} = \frac{33\frac{1}{3}}{100} = 33\frac{1}{3}\%$$

$$.50 = \frac{50}{100} = 50\%$$

$$.87\frac{1}{2} = \frac{87\frac{1}{2}}{100} = 87\frac{1}{2}\%$$

If the decimal has more than two decimal places, the figures after the second one are written as a fraction of a per cent, as,—

$$.255 = \frac{25\frac{1}{2}}{100} = 25\frac{1}{2}\%.$$

$$.163 = \frac{16^3/_{10}}{100} = 16^3/_{10}\%.$$

To change a common fraction to per cent:

1. *Change the fraction to a decimal.*
2. *Express the decimal as hundredths.*
3. *The result is the per cent desired.*

EXAMPLES:

$\frac{1}{2} = .5 = .50 = 50\%$
$\frac{3}{4} = .75 = 75\%$
$\frac{2}{3} = .66\frac{2}{3} = 66\frac{2}{3}\%$
$^9/_{10} = .90 = 90\%$
$^8/_9 = .88^8/_9 = 88^8/_9\%$
$^7/_8 = .87\frac{1}{2} = 87\frac{1}{2}\%$
$^{25}/_{26} = .96^2/_{13} = 96^2/_{13}\%$

Or, they may be written this way:

$$\frac{3}{4} = \frac{3}{4} \text{ of } \frac{100}{100} = \frac{75}{100} = 75\%$$

$$\frac{2}{3} = \frac{2}{3} \text{ of } \frac{100}{100} = \frac{66\frac{2}{3}}{100} = 66\frac{2}{3}\%$$

$$\frac{1}{2} = \frac{1}{2} \text{ of } \frac{100}{100} = \frac{50}{100} = 50\%$$

TERMS USED IN PERCENTAGE

In *Percentage*, there are five terms or quantities considered; namely, the *Base*, *Rate per cent*, *Percentage*, *Amount* and *Proceeds* or *Difference;* any two being given, a third one may be found.

The base and rate given, to find the percentage.

RULE.—*Multiply the base by the rate per cent expressed decimally.*

EXAMPLE: How many dollars is 6% of $50?

$50, the *Base*, or number on which percentage is computed.
.06, the *Rate*, or term denoting number of hundredths taken.
$3.00, the *Percentage*, or the product of the base and rate per cent.
$53.00, the *Amount*, or the base increased by the percentage.
$47.00, the *Proceeds*, or *Difference*, the base less the percentage.
Ans. $3.00.

When the rate per cent is an aliquot part of 100, the percentage is readily found by taking such a part of the base as the rate per cent is part of 100. Thus, at 10%, take $^1/_{10}$ of base; at 12½%, $^1/_8$; at 16$^2/_3$%, $^1/_6$, etc.

The base and percentage given, to find the rate.

RULE.—*Divide the percentage by 1% of the base.*

EXAMPLE: Bought a watch for $15 and sold it for $18; what per cent did I make?

.15)3.00 — Here, $15.00 is the base, and ($18 − $15) $3.00, the gain or percentage. Now, as 1% of 15.00 is .15, it is evident that 3.00 is as many per cent of 15.00, as .15 is contained times is 3.00, which is 20.
20
Ans. 20%

Proof: 20% or ⅕ of $15 = $3.

The percentage and rate given, to find the base.

RULE.—*Divide the percentage by the rate per cent expressed decimally.*

EXAMPLE: Received $6.40, percentage or interest, for money loaned at 4%, what was the base or principal?

.04)6.40 — If $1 produces .04 (4 cents) in a certain time, $6.40 must be the percentage of as many dollars as .04 is contained times in $6.40, which is 160.
Ans. $160

Proof: 4% of $160 (160 × .04) = $6.40.

The amount and rate given, to find the base.

RULE.—*Divide the given amount by 1.00 plus the rate per cent.*

EXAMPLE: Bought a horse at a certain price, and sold him for $84, making 12% on cost; what did he cost?

1.12)84.00 — If I made 12% on cost, every dollar invested gained 12 cents; hence, the horse cost as many dollars as 1.12 is contained times in 84.00, which is 75.
Ans. $75

Proof: 12% of $75 (75 × .12) = $9; $75 + $9 = $84.

The proceeds and the rate given, to find the base.

RULE.—*Divide the given proceeds by 1.00 minus the rate per cent.*

EXAMPLE: Sold a wagon for $51, which is 40% less than it cost; what did it cost?

.60)51.00 — If I lost 40%, or 40 cents on the dollar, I received only 60 cents for every dollar the wagon cost; hence, it cost as many dollars as .60 is contained times in 51.00, which is 85.
Ans. $85

Proof: 40% of $85 (85 × .40) = $34; $85 − $34 = $51.

NOTE.—The principles of percentage, in one form or another, enter into nearly all commercial calculations, besides many others. It is therefore of the utmost importance to business men, clerks, accountants, bookkeepers, and others, to become expert in percentage, and to adopt the easiest, simplest and shortest methods in computing interest, partial payments, trade discount, profit and loss, commission, insurance, stocks, bonds, taxes, exchange, etc.

PROFIT AND LOSS

When a thing is sold for more than it cost the seller, it is said to be sold at a profit. If it is sold for less than the cost, it is sold at a loss. Hence,

Profit = Selling Price − Cost Price.
Loss = Cost Price − Selling Price.

A profit or loss is generally reckoned as a percentage.

It is always understood that the percentage is reckoned on the cost price.

EXAMPLE: I buy wheat at 60 cents and sell it for 75 cents. What per cent do I gain?

SOLUTION: I gain the difference betwen 75 cents and 60 cents, or 15 cents. 15 cents is 25% of the cost. Hence, I gain 25%.

WORK:

75 cents − 60 cents = 15 cents.
15 cents ÷ 60 cents = .25, or 25%.

EXAMPLE: I bought flour at $3.50 per barrel. For what must I sell it to gain 20%?

SOLUTION: I must sell it for 100% of the cost plus 20% of the cost, or 120% of the cost.

120% of $3.50 = $4.20.
∴ I must sell it at $4.20.

EXAMPLE: I sold my carriage for 80% of its cost and received $90 for it. What was the cost?

SOLUTION:

1% of the cost is $^1/_{80}$ of $90, or $1.125.
100% of the cost = 100 × $1.125, or $112.50.

COMMISSION

is a percentage paid for buying or selling real estate, goods, etc. A consignment is a quantity of goods, sent to an agent, broker or commission merchant, for sale. The consignor is the one who sends the goods, the consignee the one to whom they are sent.

PRINCIPLES:

1. *The commission is some number or per cent of the price of what is bought or sold.*
2. *The proceeds equal the selling price minus the commission.*
3. *The amount equals the selling price plus the commission.*

Commission presents two classes of problems. One of these classes may be called "buying problems." The other may be called "selling problems."

BUYING PROBLEM: I sent my agent $1977.60 to *buy* wild farm lands in northern Wisconsin, at $3 per acre. He was to receive 3% for his work. How many acres did he buy?

WORK AND EXPLANATION:

3% of $3 = $.09.
Cost to me of 1 acre is $3 + $.09 = $3.09

For $1977.60 he buys as many acres as $3.09 is contained times in $1977.60, or 640. Hence, he buys 640 acres.

SELLING PROBLEM: My agent *sells* 360 pounds of butter for me at 20 cents. He pays $4.20 freight charges and $9.60 for storage. His commission is 5%. What does he send me?

WORK AND EXPLANATION:

360 pounds at 20 cents = $72.00
Freight is $4.20
Storage is 9.60
Commission is 5% of $72, or 3.60
Total charges = 17.40

He sends me the difference, or $54.60

TRADE DISCOUNT

is an allowance made by manufacturers and jobbers from their list or marking prices. When the market varies, they change the discount accordingly, or make several discounts instead of changing the list.

Trade discount is a certain per cent off, or from list or marking price; while profit and loss is computed on the cost or purchase price.

The amount of the discount allowed depends sometimes upon the amount of order, and sometimes upon the terms of settlement. Very often two or more discounts are deducted in succession. Thus, 10% and 5% off; or, as it is gener-

ally expressed in business, 10 and 5 off, means a discount of 10%, and then 5% from what is left; 20, 10, and 5 off, means three successive discounts. A retailer's profit is smaller when he is allowed 10 and 5 off, than if he were allowed 15 off. The result is not affected by the order in which the discounts are taken.

EXAMPLE: I receive a bill of goods amounting to $100, 20% off. What is the net cost?

FIRST WAY:	SECOND WAY:
20% of $100 = $20	100% − 20% = 80%
$100 − $20 = $80	80% of $100 = $80

EXAMPLE: A merchant receives two bills of $200 each. On one there is a discount of 25%; on the other, 15% and 10%. What must he pay on each, net?

FIRST BILL:	SECOND BILL:
100% − 25% = 75%, or ¾	100% − 15% = 85%
	100% − 10% = 90%
¾ of $200 = $150.	90% of 85% = 76.5%
	.765 × $200 = $153.

PROMISSORY NOTES

A *note* is a written promise to pay a specified sum at a certain time.

The person who promises is called the *maker*, and the person to whom he promises is called the *payee*.

The *face* of a note is the sum of money promised.

A *negotiable note* is one which is made payable to the bearer, or to the order of the payee. A negotiable note can be sold or transferred.

A note is *non-negotiable* when it is payable only to the person or persons named in the note.

An *indorser* of a note is a person who writes his name on the back of it. The person who indorses, by so doing guarantees its payment. An *indorsement in blank* is simply the signature of the indorser written across the back of the note or draft. When indorsed in this way the note or draft is made payable without further indorsement to any person holding.

A note or draft is *indorsed in full* when the indorser states, over his signature, the person to whose order the note or draft is to be paid. If an indorser does not wish to guarantee the payment of a note or draft, he writes "Without recourse" over his name when indorsing it.

A *protest* of a negotiable note or draft is a formal statement by a notary public that said note or draft was presented for payment or acceptance and refused.

A note, when due, must be presented at the place at which it is made payable. The *day of maturity* is the day on which a note becomes due.

The *days of grace* are the three days beyond the specified time for payment. Days of grace are now practically abolished throughout the United States.

KINDS OF NOTES.—There are three principal kinds of notes—*Time Notes*, *Joint Notes*, and *Joint and Several Notes*.

A *Time Note* must be paid in a specified time.

A *Joint Note* is one signed by two or more persons who are jointly liable for its payment.

A *Joint and Several Note* is a note signed by two or more persons who are both jointly and individually liable for its payment. Each man who signs the note is as much responsible for the payment of the whole sum as if he had signed alone.

LEGAL RULES THAT APPLY TO NOTES

A note made out on *Sunday* is void.

If a note does not state that *interest* is to be paid, it does not bear interest until after it is due.

If anyone obtains a note *by fraud* or from an *intoxicated person*, he cannot collect.

To be negotiable an instrument must be in writing and signed by the maker (of a note) or drawer (of a bill or check).

It must contain an unconditional promise or order to pay a certain sum in money.

Must be payable on demand, or at a fixed future time.

Must be payable to order or to bearer.

In a bill of exchange (check), the party directed to pay must be reasonably certain.

Every negotiable instrument is presumed to have been issued for a valuable consideration, and want of consideration in the creation of the instrument is not a defense against a bona-fide holder.

An instrument is negotiated, that is completely transferred, so as to vest title in the purchaser, if payable to bearer, or indorsed simply with the name of the last holder, by mere delivery; if payable to order, by the indorsement of the party to whom it is payable and delivery.

One who transfers an instrument by indorsement warrants to every subsequent holder that the instrument is genuine, that he has title to it, and that if not paid by the party primarily liable at maturity, he will pay it upon receiving due notice of non-payment.

To hold an indorser liable the holder upon its non-payment at maturity must give prompt notice of such non-payment to the indorser and that the holder looks to the indorser for payment. Such notice should be sent within twenty-four hours.

When an indorser is thus compelled to pay he may hold prior parties, through whom he received the instrument, liable to him by sending them prompt notice of non-payment upon receiving such notice from the holder.

One who transfers a negotiable instrument by delivery, without indorsing it, simply warrants that the instrument is genuine, that he has title to it, and knows of no defense to it, but does not agree to pay it if unpaid at maturity.

The maker of a note is liable to pay it, if unpaid at maturity, without any notice from the holder or indorser.

Notice to one of several partners is sufficient notice to all.

When a check is certified by a bank the bank becomes primarily liable to pay it without notice of its non-payment, and when the holder of a check thus obtains its certification by the bank, the drawer of the check and previous indorsers are released from liability, and the holder looks to the bank for payment.

A bona-fide holder of a negotiable instrument, that is, a party who takes an instrument regular on its face, before its maturity, pays value for it and has no knowledge of any defenses to it, is entitled to hold the party primarily liable responsible for its payment, despite any defenses he may have against the party to whom he gave it, except such as rendered the instrument void in its inception. Thus, if the maker of a note received no value for it, or was induced to issue it through fraud or imposition, that does not defeat the right of a bona-fide holder to compel its payment from him.

The dates and amounts of *partial payments* on a note, before it is finally paid in full, are placed on the back.

The *place of payment*, if not mentioned, is at the maker's place of business or residence, during reasonable business hours.

If a *note* or a *check* received in payment of a debt is *dishonored*, the debt revives.

Ignorance of the law does not excuse anyone. No *contract* is good unless there be a *consideration*. No consideration is good that is *illegal*.

The *maker* of an *accommodation note* is not bound to the person accommodated; but he is bound to any other person receiving the note for value.

BANK DISCOUNT

The sum charged by a *bank* for cashing a note or time draft is called *bank discount*. This discount is the simple interest, paid in advance, for the number of days the note has to run. Wholesale business houses usually sell goods on *time* and take notes from the retailers in payment. These notes are not often for a longer period than *three months*. Some are placed in the banks for collection, others are *discounted*. When a note is discounted at a bank the payee *indorses* it, making it payable to the bank. Both maker and payee are then responsible to the bank for its payment. If the note is drawing interest the discount is reckoned on and deducted from the amount due at maturity. Most notes discounted at banks do not draw interest. The *time* in bank discount is always the number of days from the date of discounting to the date of maturity.

EXAMPLE: A note of $250, dated July 7, payable in 60 days, is discounted July 7 at 6%; find the proceeds.

EXPLANATION: This note is due in 63 days, or September 8. The accurate interest of $250 for 63 days at 6% is $2.59. The proceeds, then, will be $250 − $2.59, or $247.41.

The *Present Worth* of a note or debt is a sum, which, if put at interest, will amount to that debt in the given time.

The *True Discount* is the difference between the debt at maturity and its present worth.

REMEMBER:

1. *To allow three days of grace, if the debt discounted is a note.*

2. *To add the interest due at maturity to the principal, before discounting, if the note bears interest.*

EXAMPLES: Case I.—Note not bearing interest.

What is the present worth and true discount on a note of $200, if paid 6 months before due, the discount being 6%.

SOLUTION: Amount of $1 for 6 months at 6% = $1.03. If $1.03 = amount of $1, $200 is the amount of as many dollars as $^{200}/_{1.03}$, or $194.17+.

$194.17 is the present worth. $200 − $194.17 = $5.83 true discount.

The following rule can be deduced from the foregoing solution:—

RULE: 1. *To find the present worth, divide the debt by the amount of $1 for the given time.*

2. *To find the true discount, subtract the present worth from the debt.*

Case II.—Note bearing interest.

What is the present worth of a note of $300. bearing 6% interest, due in 2 years 4 months, if money is worth 10%.

SOLUTION: Interest on $300 for 2 years 4 months at 6% = $42.

$300 + $42 = $342. Amount due at maturity.

Amount of $1 for 2 years 4 months at 10% = $1.23⅓.

If $1.23⅓ = amount of $1, then $3.42 is the amount of $\frac{342}{1.23\frac{1}{3}}$, or $277.29.

$277.29 = present worth.

INTEREST

If a person borrows money, he usually pays something for the loan.

The sum of money he borrows is called the *Principal;* the money he pays for the use of the principal is called *Interest*. Interest is generally reckoned at so much for the use of each $100 for one year. This amount is called the *Rate per cent per Annum.*

Thus, if we say that $200 is borrowed for three years at 4 per cent per annum, we mean that the borrower, at the end of each year, pays the lender $4 for each $100 borrowed—*i.e.*, $8 interest for each year.

In the above example the interest is supposed to be paid to the lender at the end of each year. Interest thus reckoned is called *Simple Interest.*

The sum obtained by adding the interest for any given time to the principal is called the *Amount* in that time.

COMMON INTEREST METHODS

If we were to find the interest on a sum of money for 3 years 4 months 5 days, we would find the interest for 1 year, then for 1 month ($^1/_{12}$ of a year), then for 1 day ($^1/_{360}$ of a year). Having the interest for 1 year 1 month 1 day, it is a simple matter of multiplication to get it for 3 years 4 months 5 days.

EXAMPLE:

What is the interest on $520 for 1 year 3 months at 6%?

WORK:

1 year 3 months = 1¼ year

$520 principal

.06

4)$31.20 interest 1 year

$7.80 interest ¼ year

$39.00 interest 1¼ year

THE 60-DAY INTEREST METHOD

In what is called the 60-Day Method, 360 days are considered one year, and 30 days one month. Upon this basis the interest for 60 days, or two months, at any rate, will be $^1/_6$ of the interest for one year; and when the rate is 6% the interest for 60 days is one per cent or $^1/_{100}$ of the principal. Thus, the interest of $247 for 60 days at 6% is $2.47.

EXAMPLE: Find the interest of $1728 for 80 days at 6%.

WORK:		EXPLANATION:
$17	28 = interest for 60 days.	The interest of $1728 for 60 days at 6% is 1% of $1728, or $17.28; and the interest for 20 days (⅓ of 60) is ⅓ of $17.28, or $5.76. Hence for 80 days it will be $17.28 plus $5.76, or $23.04.
5	76 = interest for 20 days.	
$23	04 = interest for 80 days.	

METHODS OF RECKONING TIME

The Common Method.—When the time is long, generally 30 days are considered a month.

The Exact Method.—When the time is short, the exact number of days is generally counted but we sometimes find the exact number of days also when the time is long.

The Bankers' Method.—Bankers get the exact number of days between two dates, but each day is reckoned as $^1/_{360}$ of a year.

PROBLEM, when the time is long.
Find the time between April 12, 1895, and September 22, 1899.

BEST METHOD

From April 12, 1895, to April 12, 1899, is 4 *years.*
From April 12, 1899, to Sept. 12, 1899, is 5 *months.*
From Sept. 12, 1899, to Sept. 22, 1899, is 10 *days.*
Time between dates = 4 years 5 months 10 days.

ANOTHER METHOD

1899	9	22
1895	4	12
4	5	10

PROBLEM, when the time is short.
Find the difference in time between April 12 and July 15, 1902.

WORK:

Number of days left in April = 18
in May = 31
in June = 30
in July = 15
Total number of days = 94

NOTE.—If the rate and principal are given, it is a simple matter to find the interest, now that we have the time.

Example of the use of Table: What is the time from February 10 to October 18, in the same year. February 10 is numbered 41, and October 18 is numbered 291; 291 − 41 = 250, *Ans.* This includes the last day, but not the first. If both days are taken, subtract 40 from 291 = 251, *Ans.* When February 29 occurs in a term, count an additional day. The day of the date of a note is not included in its term; thus, required the last day of grace of a note dated March 24, at 90 days. March 24 = 83; 83 + 93 = 176 = June 25, *Ans.*

COMPOUND INTEREST

Interest computed, at regular intervals, on the sum of the principal and any unpaid interest, is called *compound interest.* In other words, as soon as interest becomes due and is unpaid, it begins to draw interest at the same rate as the principal. Compound interest is generally paid on the deposits in savings banks and is used in calculating amortization and sinking funds.

Interest may be compounded quarterly, semi-annually, annually, or at the end of any other period agreed upon. In some States the collection of compound interest is not permitted.

EXAMPLE: Find the amount and the compound interest of $1200 at 6% for two years, interest compounded semi-annually.

SOLUTION:

$1200.00	First principal
36.	Interest for 6 months
1236.	Principal at beginning of second 6 months
37.08	Interest for second 6 months
1273.08	Principal at beginning of third period
38.19	Interest for third period
1311.27	Principal at beginning of fourth period
39.34	Interest for fourth period
$1350.61	Amount at end of two years
$1350.61	Amount at end of two years
1200.00	Principal
$ 150.61	Compound interest.

EXCHANGE

in commerce is a method of making payments in distant places, without the actual

TABLE OF TIME, IN DAYS

The following table gives the exact time, in days, between two dates.

Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
1	32	60	91	121	152	182	213	244	274	305	335
2	33	61	92	122	153	183	214	245	275	306	336
3	34	62	93	123	154	184	215	246	276	307	337
4	35	63	94	124	155	185	216	247	277	308	338
5	36	64	95	125	156	186	217	248	278	309	339
6	37	65	96	126	157	187	218	249	279	310	340
7	38	66	97	127	158	188	219	250	280	311	341
8	39	67	98	128	159	189	220	251	281	312	342
9	40	68	99	129	160	190	221	252	282	313	343
10	41	69	100	130	161	191	222	253	283	314	344
11	42	70	101	131	162	192	223	254	284	315	345
12	43	71	102	132	163	193	224	255	285	316	346
13	44	72	103	133	164	194	225	256	286	317	347
14	45	73	104	134	165	195	226	257	287	318	348
15	46	74	105	135	166	196	227	258	288	319	349
16	47	75	106	136	167	197	228	259	289	320	350
17	48	76	107	137	168	198	229	260	290	321	351
18	49	77	108	138	169	199	230	261	291	322	352
19	50	78	109	139	170	200	231	262	292	323	353
20	51	79	110	140	171	201	232	263	293	324	354
21	52	80	111	141	172	202	233	264	294	325	355
22	53	81	112	142	173	203	234	265	295	326	356
23	54	82	113	143	174	204	235	266	296	327	357
24	55	83	114	144	175	205	236	267	297	328	358
25	56	84	115	145	176	206	237	268	298	329	359
26	57	85	116	146	177	207	238	269	299	330	360
27	58	86	117	147	178	208	239	270	300	331	361
28	59	87	118	148	179	209	240	271	301	332	362
29	—	88	119	149	180	210	241	272	302	333	363
30	—	89	120	150	181	211	242	273	303	334	364
31	—	90	—	151	—	212	243	—	304	—	365

transmission of money, but by a Bill of Exchange called *Draft*, which is a written request upon one person to pay a certain sum to another or to his order. The person who orders the money to be paid, is called the *Drawer;* the one who is directed to pay it, the *Drawee*, and the one to whom it is directed to be paid, the *Payee*.

Domestic or *Inland Exchange* is exchange between places in the same country: *Foreign Exchange*, between different countries.

If, for every little business transaction, money had to be sent from one business center to another, much needless inconvenience and expense would be incurred.

A man in Chicago owes a man in New York City a sum of money. He can send it to him in one of five ways:—

1. By Check.
2. By Post-office Order
3. By Express Order
4. By Bill of Exchange
5. By Telegraph

Suppose Mr. White of Chicago owes Mr. Brown of Boston $200 for groceries and Mr. Allen of Boston owes Mr. Warner of Chicago $200 for rent. Wouldn't it save expense and trouble if Mr. White should go to Mr. Warner and Mr. Allen to Mr. Brown? Thereby two debts are cancelled by two city transactions and no money need be sent from one city to another.

This is all there is to Exchange, only in business life banks instead of individuals transact the business.

Only a small percentage of the money really passes from one city to another.

Exchange in the United States is carried on mostly by banks located in the large cities, which charge a small fee for transacting the business.

If the drawee accepts the draft, he writes

TABLE OF COMMERCIAL LAW IN THE STATES

	INTEREST LAWS		STATUTES OF LIMITATION			EXEMPTION LAWS	
	LEGAL RATE PER CENT	PER CENT ALLOWED BY CONTRACT AND PENALTY FOR USURY	JUDGMENTS	NOTES	OPEN ACCOUNTS	PERSONAL PROPERTY, EXEMPT	HOMESTEAD, EXEMPT
Alabama	8	8; Forfeit interest	20 yrs.	6 yrs.	3 yrs.	$1,000	$2,000
Arizona	6	12; No provision	4 yrs.	4 yrs.	3 yrs.	500	2,500
Arkansas	6	10; Forfeit principal and interest	10 yrs.	5 yrs.	3 yrs.	500	2,500
California	7	Any; No provision	5 yrs.	4 yrs.	4 yrs.	.....	5,000
Colorado	8	Any; No provision	6 yrs.	6 yrs.	6 yrs.	.....	2,000
Connecticut	6	15; Fine or imprisonment, or both.	7 yrs.	6 yrs.	6 yrs.	.....	1,000
Delaware	6	6; Principal and interest forfeited	10 yrs.	6 yrs.	3 yrs.	200	.....
Dist. of Col.	6	6; Forfeit interest	12 yrs.	3 yrs.	3 yrs.	300	.....
Florida	8	10; Forfeit interest	20 yrs.	5 yrs.	3 yrs.	1,000	160 acres
Georgia	7	8; Forfeit excess of interest	7 yrs.	6 yrs.	4 yrs.	300	1,600
Idaho	7	12; Forfeit interest and 10% of principal	6 yrs.	5 yrs.	4 yrs.	.....	5,000
Illinois	5	7; Forfeit interest	20 yrs.	10 yrs.	5 yrs.	400	1,000
Indiana	6	8; Excess interest forfeited	20 yrs.	10 yrs.	6 yrs.	600	or 600
Iowa	6	8; Forfeit interest and 8% of principal	20 yrs.	10 yrs.	5 yrs.	200	or 40 acres
Kansas	6	10; Forfeit of double amount of usurious interest	5 yrs.	5 yrs.	3 yrs.	.....	160 acres
Kentucky	6	6; Forfeit of interest	15 yrs.	15 yrs.	5 yrs.	250	1,000
Louisiana	5	8; Forfeit interest	10 yrs.	5 yrs.	3 yrs.	.....	Total, 2,000
Maine	6	Any; No provision	20 yrs.	20 yrs.	6 yrs.	.....	500
Maryland	6	6; Forfeit interest	12 yrs.	3 yrs.	3 yrs.	100	.....
Massachusetts	6	Any; No provision	20 yrs.	6 yrs.	6 yrs.	.....	800
Michigan	5	7; Forfeit interest	6 and 10	6 yrs.	6 yrs.	500	1,500
Minnesota	6	10; Forfeit interest	10 yrs.	6 yrs.	6 yrs.	500	80 acres
Mississippi	6	10; Forfeit interest	7 yrs.	6 yrs.	3 yrs.	.....	2,000
Missouri	6	8; Forfeiture or misdemeanor	10 yrs.	10 yrs.	5 yrs.	300	1,500(min.)
Montana	8	Any; No provision	10 yrs.	8 yrs.	5 yrs.	.....	2,500
Nebraska	7	10; Forfeit interest	5 yrs.	5 yrs.	4 yrs.	500	or 2,000
Nevada	7	Any; No provision	6 yrs.	6 yrs.	4 yrs.	.....	5,000
New Hampshire	6	6; Forfeit three times excess	20 yrs.	6 yrs.	6 yrs.	.....	500
New Jersey	6	6; Forfeit interest and costs	20 yrs.	6 yrs.	6 yrs.	200	1,000
New Mexico	6	12; Forfeit of twice the amount of interest	7 yrs.	6 yrs.	4 yrs.	500	1,000
New York	6	6; Forfeit of principal and interest; misdemeanor	20 yrs.	6 yrs.	6 yrs.	250	1,000
North Carolina	6	6; Forfeit interest	10 yrs.	3 yrs.	3 yrs.	500	1,000
North Dakota	7	12; Forfeit interest	10 yrs.	6 yrs.	6 yrs.	1,000	5,000
Ohio	6	8; Forfeit interest over 6%	5 yrs.	15 yrs.	6 yrs.	100	1,000
Oklahoma	6	10; Forfeit interest	5 yrs.	5 yrs.	3 yrs.	.....	5,000
Oregon	6	10; Forfeit principal and interest	10 yrs.	6 yrs.	6 yrs.	.....	1,500
Pennsylvania	6	6; Forfeit excess of interest	20 yrs.	6 yrs.	6 yrs.	300	.....
Rhode Island	6	Any; No provision	20 yrs.	6 yrs.	6 yrs.	500	.....
South Carolina	7	8; Forfeit interest	20 yrs.	6 yrs.	6 yrs.	500	1,000
South Dakota	7	12; Misdemeanor	20 yrs.	6 yrs.	6 yrs.	750	5,000
Tennessee	6	6; Forfeit of excess interest	10 yrs.	6 yrs.	6 yrs.	.....	1,000
Texas	6	10; Forfeit interest	10 yrs.	4 yrs.	2 yrs.	500	5,000
Utah	8	12; Forfeit excess interest	8 yrs.	6 yrs.	4 yrs.	.....	2,000
Vermont	6	6; Forfeit of excess interest	8 yrs.	6 yrs.	6 yrs.	200	500
Virginia	6	6; Forfeit interest	20 yrs.	5 yrs.	2 yrs.	.....	2,000
Washington	6	12; Forfeit of double accrued interest and costs	6 yrs.	6 yrs.	3 yrs.	1,000	2,000
West Virginia	6	6; Forfeit excess interest	10 yrs.	10 yrs.	5 yrs.	200	1,000
Wisconsin	6	10; Forfeit treble amount of usurious interest paid	20 yrs.	6 yrs.	6 yrs.	200	5,000
Wyoming	8	12; Forfeit interest	5 yrs.	5 yrs.	8 yrs.	500	1,500

NOTE.—In many of the States it is impossible to place a fixed amount on personal property exempt. In the table above these states have no amount given in the personal property column. Days of grace have been abolished in all states except the following: Arkansas, Mississippi, South Carolina and Texas.

across the face of it *"Accepted"* with the date and his signature. This is called an *Acceptance.*

Once accepted, the draft becomes a note, with the same laws regulating it. If the draft is not accepted, it is not binding and we say that it has been *"dishonored."*

A bill of exchange is entitled to days of grace, if it is payable in a State where grace is allowed, unless a particular day is named in the draft. In most States, no grace is allowed on sight drafts.

Principles of Exchange

To find the cost of a draft, the face and rate per cent of exchange being given.

Rule.—*Find the percentage of the given rate per cent of exchange and add it to, or subtract it from the amount of draft.*

Example: What is the cost, in Chicago, of a sight draft on Denver for $400, if exchange is ¾% premium; and how much if ½% discount?

$400 × .00¾ = $3; $400 + $3 = $403, at ¾% premium.

$400 × .00½ = $2; $400 − $2 = $398, at ½% discount.

To find the face of a draft, cost and rate per cent of exchange given.

Rule.—*Divide by the cost of a draft for $1, at given rate per cent of exchange.*

Example: Find face of draft that can be bought for $1000 at 1% premium; at 1% discount.

$1000 ÷ 1.01 = $990.10, at 1% premium.
$1000 ÷ .99 = $1010.10, at 1% discount.

Time Drafts, when negotiated before maturity, are subject to discount which is computed on the face of the draft, the same as interest.

Example: What is the proceeds of a 60-day draft for $800, at ⅝% premium, and discounted at 7%?

$805.00, face + ⅝% premium
9.33, interest (7%, 60 days)

$795.67, proceeds. *Ans.*

Foreign Drafts are usually made payable in the money of the country on which they are drawn.

To find the equivalent of foreign money in United States money and vice versa.

Rule.—*Multiply, or divide (as the case may require) the given sum, by the equivalent of a unit in United States money.*

Example: What is the cost of a draft on London for £125, reckoning exchange at $4.8665?

125 × 4.8665 = 608.31. *Ans.* $608.31.

Wishing to remit $182.50 to Ireland, for what amount must I buy a draft on London?

182.50 ÷ 4.8665 = 37.5. *Ans.* £37½.

How many francs in $100?
100.000 ÷ .193 = 518.13. *Ans.* 518.13 francs.

How many dollars in 7500 German marks?
7500 × .238 = $1785, *Ans.*

How many Swedish crowns in $750?
750 ÷ .268 = 2798½ crowns, *Ans.*

How many dollars in 4635 rubles?
4635 × .772 = $3578.32, *Ans.*

A simple method to reduce pounds sterling to United States money, and vice versa; exchange being at $4.8665.

Rule.—*Multiply pounds sterling by 73, and divide the product by 15. Or multiply dollars by 15 and divide the product by 73.*

Examples: How many dollars in £85?
$85 \times {}^{73}/_{15} = 413.67$. *Ans.* $413.67.

How many £'s in $748.25?
$748.25 \times {}^{15}/_{73} = 153¾$. *Ans.* £153¾.

Another method to change pounds sterling, shillings and pence, to dollars and cents.

Rule.—*Reduce pounds sterling to shillings, add the shillings, and multiply the sum by .24⅓ —the product will be cents. Add 2 cents for each pence, if any.*

Example: Change £46, 13s. 9d. to United States money.

46 × 20 = 920
13
933

933 × .24⅓ = 227.03
9d. = .18
Ans. $227.21

Tourists of today patronize express companies for *Foreign Money Orders.* These are made out similar to regular express money orders and may be cashed in any of the larger cities of all foreign countries. They take the place, to a large extent, of *Letters of Credit,* which are letters from banking houses in one country to those in another, allowing sums to be drawn not to exceed a total named in the letter.

STOCKS AND BONDS

Stocks is a general name given to the capital of incorporated companies. They are divided into equal parts, usually of $100 each, called *Shares,* the owners of which are called *Stockholders.* A *Dividend* is a part of the net income of the company, divided among the stockholders.

A *certificate of stock* is a written paper signed by the proper officers of the corporation, naming the number of shares to which the person named therein is entitled, and the original value of the same.

Preferred stock is stock which is given a preference over the common stock. Ordinarily, a dividend is paid on the preferred stock before any is paid on the common shares.

Common stock is the ordinary stock of a corporation, which has no preference, in the payment of dividends, over any other.

The *par value* of a share of stock is the value named in the certificate of stock.

When a corporation is prosperous, its shares of stock often sell for more than the value named in the certificate of stock. They are then said to be *above par,* or *at a premium.* In times of business depression, often these shares of stock sell below their face value. They are then said to be *below par,* or *at a discount.*

The *market value* of a share of stock is the value for which it sells in the open market.

A *stock broker* is one who makes a business of buying and selling stocks and bonds. He charges a commission for this which is called *brokerage.*

A *surplus* is a part of the earnings of a corporation.

The *gross earnings* of a corporation are its total receipts from all sources.

The *net earnings* are the profits remaining when all expenses, losses, interest and debts due are paid.

An *assessment* is a sum levied proportionate to stock held by stockholders, to help out the business when it is not prospering, or when more money is needed to carry it on. It is levied as so many dollars on each share at its par value.

The *directors* are those shareholders elected by all to manage the affairs of the corporation.

A *bond* is, in form, a carefully drawn interest-bearing promissory note. Ordinarily, it runs for a period of years with interest often payable semi-annually. It is more formal than the ordinary promissory note. Bonds are usually

issued by national, state, county, or local governments, or by corporations, when they wish to raise large sums of money for immediate use.

DIFFERENCE BETWEEN STOCKS AND BONDS

A bond runs for a specified time. It bears a specified interest, and is an absolute promise to pay the face of it at maturity. It matures at a definite time, and at that time the holder is paid it *face value* and no more, by the organization that issued it, unless such organization is insolvent, or has repudiated its debts.

Stocks.—A certificate of stock is no promise to pay. It simply shows that the holder owns as much stock in the corporation as is shown by the face of the certificate. It bears no interest and has no date of maturity.

The interest returns of the bondholder are certain and definite. The returns of the stockholder, dividends, are uncertain and depend on the profits of the business.

Consequently, no table can be arranged to show at what rate stocks can be bought to yield a definite return; but with bonds, tables may be made which show at a glance what the return will be from a purchase made at any rate.

APPLICATION OF PERCENTAGE TO STOCKS

1. To find the value of stocks, when above or below par.

RULE.—*Multiply the price per share, by the number of shares.*

EXAMPLE: Find cost of 65 shares of bank stock, at $107 per share, or 7% premium. Also of 48 shares of railroad stock, at $87½ per share, or 12½% discount.

(1) $65 \times 107 = 6955$. *Ans.* $6955.
(2) $48 \times 87\frac{1}{2} = 4200$. *Ans.* $4200.

2. To find what rate per cent is realized by investing in stocks or bonds when above or below par.

RULE.—*Annex two ciphers to the fixed rate per cent, and divide by the cost per share.* Or by proportion: *As the cost per share is to the fixed rate, so is 100 to the required rate.*

EXAMPLE: Mr. Warren bought ten shares of Illinois Central Railroad stock at 96. What does he get when a dividend of 6% is declared? What per cent is that on his investment?

WORK AND EXPLANATION:

(1) 1 share at 6% yields $6
10 shares yield $10 \times \$6 = \$60$.
(2) Each share at 96 costs $96.
Each share yields $6.
Query? $6 is what per cent of $96?
$6 is $^6/_{96}$ of 100%, or 6¼%.
∴ the investment yields 6¼%.

3. To find which is the more profitable investment.

RULE.—*Find the rate per cent that each investment yields, by rule, under item 2; then compare rates.*

EXAMPLE: Which is the better investment; 6% mortgages at 10% premium, or 5% bonds at 10% discount?

(1) $110)600(5^5/_{11}\%$.
(2) $90)500(5^5/_9\%$. $5/9 - 5/11 = {}^{10}/_{99}$, practically $^1/_{10}$.
Ans. The latter, by $^1/_{10}$ of 1%, nearly.

TAXES AND TAXATION

A *tax* is a contribution levied on persons, property, incomes, or business, for public purposes.

SOME USES FOR TAXES.—The *National Government* requires money to support the army and navy, to pay the salaries of government employes, to pay pensions, and to finance other activities carried on by the nation.

The *State Governments* require money for the expense of their officers, and to support their various institutions, schools, universities, asylums, and penitentiaries.

The *counties* require money for the building of bridges, the trial of criminal cases, the salaries of officers, the relief of the poor, etc.

Cities must pay for police and fire protection, care of streets, etc.

School districts contribute to the support of the public schools.

The money required for all these expenses is raised by taxes, licenses, fees, assessments, and fines.

STATE AND LOCAL TAXES.—The amount of tax paid by any individual to state and local governments depends upon the value of the property which he owns and the tax rate. In many places the adult male citizen pays a poll tax.

The tax levied on property is called a *property tax.*

The tax levied on persons is called a *poll tax.* This is cometimes called a *capitation* (by the head) *tax.*

Sometimes a man's income is taxed. This is an *income tax.*

After the amount of money to be raised by tax is decided upon, a man, called the *assessor,* examines each piece of taxable personal property and real estate, and places a value upon it. This is taken as a basis for proportioning the tax among the property owners.

A *tax collector* is one who collects the taxes. He is sometimes paid a salary. Sometimes he gets only a percentage of the money he collects.

The *treasurer* receives and takes care of the money collected by the tax collector. He is paid a salary.

THE TAX RATE.—Sometimes the rate is fixed by law or by vote of the citizens. More often the lump sum to be raised is named, and the assessor determines the rate.

When the assessor is to determine the rate, he proceeds in this way: First, he assesses each piece of property, usually not at its full market value. Then he determines the total value of all the property in his district. Next, he divides the total tax to be raised by the total value of the property in his district. The result is the *rate of tax* on the dollar.

USE OF THE MILL IN TAXES.—When a tax is apportioned, it is usually found that if a few mills are paid on each dollar's worth of property in the district, the aggregate amount is equal to the whole sum of tax needed. Consequently, we often hear of tax levies of so many *mills* on the *dollar,* as, 2 mills on the dollar, 5 mills on the dollar, etc.

The denomination of our money system called the *mill* has practically its only use in the levy of taxes.

Assessors make use of a table like the one given on the following page. This table is based on a tax levy of 9 mills on the dollar.

The following tax rates are equivalent:

16 mills (on the dollar);
1.6%;
$1.60 (on each hundred dollars).

EXPLANATION OF TABLE. The second column shows the tax at nine mills on the dollar, for values of $1 to $30.

The fourth column shows the tax for values of $40 and multiples of ten, to $600. The sixth column shows the tax for values of $700 and multiples of one hundred, to $10,000.

TAX TABLE

PROPERTY VALUE	TAX	PROPERTY VALUE	TAX	PROPERTY VALUE	TAX
$ 1	$0.009	$ 40	$0.36	$ 700	$ 6.30
2	0.018	50	0.45	800	7.20
3	0.027	60	0.54	900	8.10
4	0.036	70	0.63	1,000	9.00
5	0.045	80	0.72	2,000	18.00
6	0.054	90	0.81	3,000	27.00
7	0.063	100	0.90	4,000	36.00
8	0.072	200	1.80	5,000	45.00
9	0.081	300	2.70	6,000	54.00
10	0.09	400	3.60	7,000	63.00
20	0.18	500	4.50	8,000	72.00
30	0.27	600	5.40	9,000	81.00

THE AMOUNT OF TAX.—To find the amount of tax to be paid by any property owner.

RULE.—*Multiply the assessed value of the property by the tax rate.*

EXAMPLE: Taylor's property is assessed at $3800. The rate is 24 mills.

SOLUTION: $3800 assessed valuation
.024 tax rate in mills

$91.20 tax.

EXAMPLE: The town of Grant is to raise $4725 in tax. The property in the town has an assessed valuation of $395,140. What is the rate?

If on $395,140 a tax of $4725 is to be raised, on $1 as much tax must be raised as $395,140 is contained times in $4725, which is .0119+, or about $.0119. This would be called $0.012, or 12 mills on the dollar.

EXAMPLE: Finch's property is assessed at $5470. The tax rate is $1.95.

SOLUTION:
$1.95 the rate per hundred dollars
54.70 the number of hundreds of dollars assessed value

$106.67 the tax.

INDIRECT TAXES are taxes placed upon goods by the national government, and collected before the goods are sold to the consumer.

The national government needs this money to pay:—

1. Interest on the public debt.
2. To support an army and navy, to build vessels, and keep up arsenals and forts.
3. To pay pensions.
4. To improve the rivers and harbors.
5. To pay the salaries of its officers; as, the president, cabinet officers, judges, ministers to foreign countries, congressmen, etc.

Indirect taxes are of two kinds, *customs* or *duties*, and *excises* or *internal revenue*.

Excises or *internal revenue* are taxes levied on certain domestic goods, as, manufactured tobacco, liquors, and the like.

Indirect taxes levied by the government on imported goods or merchandise are called *duties* or *customs*.

A *custom house* is a government office where duties are collected and where vessels are entered and cleared. Nearly every seaport of consequence has a custom house. So also have important towns near the Canadian and Mexican boundaries.

Duties are of two kinds, *specific* and *ad valorem*.

A *specific* duty is one levied at a specified sum per yard, gallon, ton, etc.

An *ad valorem* duty is one levied at a certain percentage of the value of the goods, at the port of export.

Tare is an allowance made for the weight of bags, barrels, or cases, in which merchandise is shipped.

Leakage is an allowance made for loss of liquids from casks, barrels, etc., in shipping.

Breakage is an allowance made for the loss of liquids from bottles in shipping.

EXAMPLE: Find the duty on 4 dozen bottles of cologne, allowing 4% for leakage and 3% for tare. The invoice value is 90 cents a bottle and the duty is 25% ad valorem and 20 cents specific. Find the total cost per bottle.

WORK AND EXPLANATION:

Leakage and tare are 4% + 3% = 7%.
4 dozen bottles = 48 bottles.

The invoice value of 48 bottles is 48 × 90 cents = $43.20
Tare and leakage are 7% of $43.20 = $ 3.024

Value on which duty is paid..... $40.176

Ad valorem duty is 25% of $40.176 = $10.044
Specific duty is 48 × 20 cents = 9.60

Total duty..... $19.644

The total cost is
Invoice value..... $43.20
Ad valorem duty..... 10.04
Specific duty..... 9.60

$62.84

The total cost per bottle is 1/48 of $62.84, or $1.31 −.

SQUARE ROOT AND CUBE ROOT

POWERS AND ROOTS.—When a product consists of the same factor repeated any number of times it is called a *power* of that factor.

7×7 is the *second power*, or the *square* of 7.

$7 \times 7 \times 7$ is the *third power*, or the *cube* of 7.

A power of a number is generally expressed by writing the number only once, and placing after it, above the line, a small figure to show how many factors are to be taken. The small figure is called an *index*.

Thus, $7^2 = 49$; $7^3 = 343$; $7^4 = 2401$.

A number is called the *square root* of its square.

Since $7^2 = 49$, the square root of 49 is 7.

The "square root of 49" is written $\sqrt{49}$.

Again, a number is called the *cube root* of its cube. $7^3 = 343$. Therefore, the cube root of 343 is 7.

The "cube root of 343" is written $\sqrt[3]{343}$.

A *perfect square* is a number whose square root is a whole number. A *perfect cube* is a number whose cube root is a whole number.

SQUARE ROOT.—If a number can be put into prime factors, its square root can be written down by inspection.

EXAMPLE: Find the square root of 27225.

Since $27225 = 3^2 \times 5^2 \times 11^2$.
$\therefore \sqrt{27225} = 3 \times 5 \times 11 = 165$ *Ans.*

RULE FOR DIGITS.—We know that $\sqrt{1} = 1$, and $\sqrt{100} = 10$. Therefore, the square root of any number which lies between 1 and 100 lies between 1 and 10; *i.e.*, if a number contains one or two digits, its square root consists of one digit.

Similarly, since $\sqrt{100} = 10$ and $\sqrt{10000} = 100$, the square root of a number between 100 and 10000 lies between 10 and 100. That is, if a number contains three or four digits, its square root consists of two digits.

Proceeding in this way, we obtain a general result—viz., the square of a number has either twice as many digits as the number, or one less than twice as many.

Hence, to ascertain the number of digits in the square root of a perfect square, mark off the

digits in pairs, beginning from the right. Each pair marked off gives a digit in the square root; and, if there is an odd digit remaining, that digit also gives a digit in the square root.

EXAMPLES: There are three digits in the square root of 546121, and four in the square root of 5774409.

For, marking off the digits from the right, we get in the first case 54,61,21, giving three digits in the square root, and in the second case 5,77,44,09, the odd digit giving the fourth in the square root.

The method of finding the square root of a given number depends on the *form* of the square of the sum of two numbers.

EXPLANATION: The square root of 144 is 12. Let us see how we found it.

$12 = 1 \text{ ten} + 2 \text{ units}.$

12^2 is the same as $(10 + 2)^2$.

Let us square $(10+2)$, that is, multiply $10+2$ by $10+2$.

$$\begin{array}{l} 10 + 2 \\ 10 + 2 \\ \hline 10^2 + (10 \times 2) \\ \quad + (10 \times 2) + 2^2 \\ \hline 10^2 + 2\,(10 \times 2) + 2^2 \end{array}$$

Then, $12^2 = 10^2 + 2\,(10 \times 2) + 2^2$

RULE.—*The square of any number made up of tens and units is equal to the square of the tens, plus twice the product of the tens by the units, plus the square of the units.*

ANOTHER EXPLANATION: Find the square root of 45369.

SOLUTION:

$4\cdot53\cdot69)213$ 4	(1) Point off the number into periods of two figures each, as before.
$41 \mid 53$ 41	(2) The square root of the first period is 2. $2 \times 2 = 4$. Write the 2 in the root and subtract the 4 from 4. Bring down the next period, 53.
$423 \mid 1269$ 1269	(3) $2 \times 2 = 4$. (Remember the 4 is to be used as a trial divisor, being $2 \times$ the *tens*.) 4 is contained in 5 about 1 time. Place 1 in the root, also on the right of the 4 in the divisor. Multiply 41 by 1. Subtract and bring down the next period.
	(4) $2 \times 21 = 42$. 42 is the *trial divisor*. $126 \div 42 =$ *about* 3 times. Place the 3 in the root also at the right of the 42 in the divisor. Mulitply out. Square root = 213.

CUBE ROOT.—The *cube root* of a number is one of the three equal factors of that number.

Thus, 5 is the cube root of 125, because $5 \times 5 \times 5 = 125$.

The *radical sign* with a figure 3 over it ($\sqrt[3]{\ }$) means that the cube root of the number following it is to be taken.

$\sqrt[3]{125}$ reads, "The cube root of 125."

If we can find the prime factors of any perfect cube, we can write down its cube root by inspection.

EXAMPLE: Find the cube root of 74088.

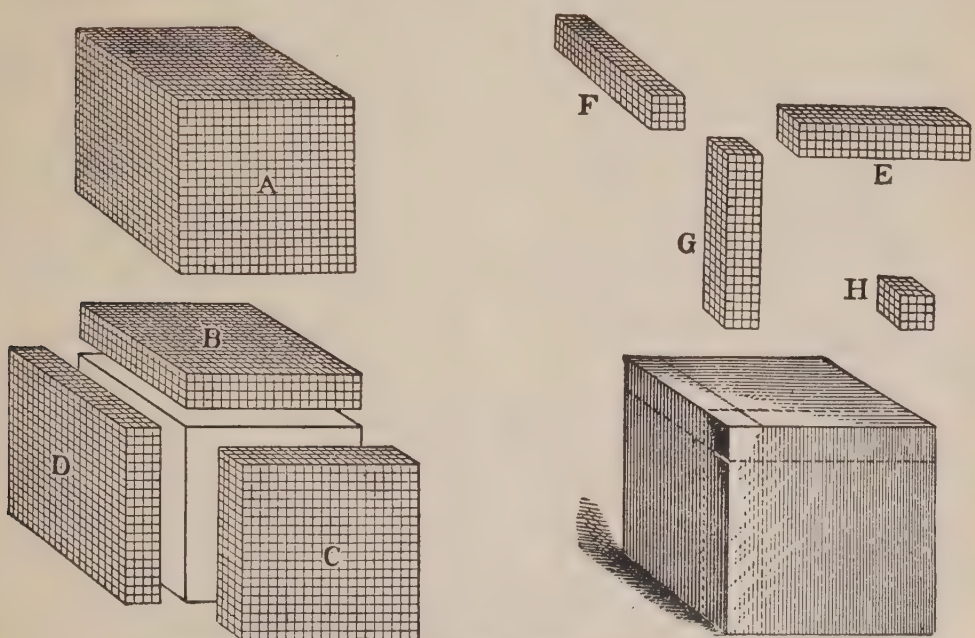
$8 \mid 74088$		
$9 \mid 9261$	$\therefore 74088$	$= 8 \times 9 \times 3 \times 7 \times 7 \times 7$
$3 \mid 1029$		$= 2^3 \times 3^3 \times 7^3$
$7 \mid 343$	$\therefore \sqrt[3]{74088}$	$= 2 \times 3 \times 7$
$7 \mid 49$		$= 42$ *Ans.*
7		

RULE FOR DIGITS.—Since $1^3 = 1$ and $10^3 = 1000$, therefore the cube of a number which lies between 1 and 10 lies between 1 and 1000, *i. e.*, the cube of a number of one digit contains either one, two or three digits.

Again, since $10^3 = 1000$ and $100^3 = 1000000$, the cube of a number of two digits contains either four, five, or six digits.

Proceeding in this way, we see that the cube of a number contains three times, or one less or two less than three times, as many digits as the number.

Hence, to find the number of digits in the cube root of a given number, we mark off the digits in sets of three, beginning at the decimal point, and marking both to the right and to the left.



FIGURES REPRESENTING THE PROCESSES OF FINDING CUBE ROOT

Thus, 289383 will be pointed off into two periods—289·383—and we readily see there will be only 2 figures in the root.

The simplest method of finding the cube root of numbers whose prime factors are not known is analogous to the method of finding square root, being based upon the form of the cube of the sum of two numbers.

EXPLANATION: The cube root of 1728 is 12. Let us see how we found it.

$12 = 1 \text{ ten} + 2 \text{ units}$

$12^3 = (10 + 2)^3$

$(10 + 2)^3$ means $10 + 2 \times 10 + 2 \times 10 + 2$

$10 + 2$

$10 + 2$

$10^2 + (10 \times 2)$
$+ (10 \times 2) + 2^2$

$10^2 + 2\ (10 \times 2) + 2^2$
$10 + 2$

$10^3 + 2\ (10^2 \times 2) + (10 \times 2^2)$
$(10^2 \times 2) + 2\ (10 \times 2^2) + 2^3$

$10^3 + 3\ (10^2 \times 2) + 3\ (10 \times 2^2) + 2^3$

That is, the cube of any number made up of tens and units equals—

The cube of the tens + three times the product of the square of the tens by the units + three times the product of the tens by the square of the units + the cube of the units,

or

$\text{tens}^3 + 3\ (\text{tens}^2 \times \text{units}) + 3\ (\text{tens} \times \text{units}^2) + \text{units}^3$.

For graphic illustration the geometrical representation of the cube of units and tens in the drawings is helpful.

After the process is understood, this short method of writing the work may be used by the pupil:

EXAMPLE: Find the cube root of .0163956, carrying the root to 3 decimal places.

CHEMISTRY

ITS USE AND IMPORTANCE—WHAT IT IS—HOW IT DIFFERS FROM PHYSICS—ITS DIVISIONS—DISTINCTION BETWEEN THEORETICAL AND PRACTICAL CHEMISTRY—OUTLINE OF THEORETICAL CHEMISTRY—LAWS OF CHEMISTRY—ATOMIC THEORY—CHEMICAL NOTATION—MOLECULAR WEIGHTS—REACTIONS—CHEMICAL ARITHMETIC—BASES—QUANTIVALENCE—TESTS—TABLE OF CHEMICAL ELEMENTS—CHEMISTRY OF FAMILIAR THINGS—COMMON NAMES OF CHEMICALS—RADIO-ACTIVITY AND RADIO-ACTIVE SUBSTANCES—RADIUM AND ITS USES—THE SPINTHARISCOPE

IMPORTANCE OF CHEMISTRY

A certain amount of knowledge of chemistry is eminently useful in almost every walk of life. An intelligent knowledge of the chemistry involved in the processes of the kitchen, the dairy, the dye-house, the farm, or the manufactory, places the possessor engaged in any of these processes on a different level from the rule-of-thumb worker, who is as ignorant of the reason for adopting a particular method as he is of the properties of the materials he employs.

Technical chemistry deals especially with the application of the principles and processes of chemistry to the arts and manufactures, and it is to those who are engaged in manufactures of almost every kind that a knowledge of chemistry is a particular advantage.

It is not a question of expediency alone, but one of absolute necessity that a technical education, including chemistry as one of its principal subjects, should form not the least important part of the equipment for his work of any artisan who is to excel in his employment in intelligence and skill.

What is chemistry?

Chemistry is that branch of science which treats of the *intimate composition of matter*, and the changes produced in it when subjected to particular conditions—such as *temperature, pressure, mass, light, catalysis*, etc.

How does chemistry differ from physics?

The two branches, physics and chemistry, overlap a great deal, it being very difficult to draw the line of demarcation between them, particularly in the higher stages of the *physical* and *chemical* changes of matter.

For example, a steel needle rubbed on a magnet in a definite way undergoes *physical* change by means of which it acquires the power of the magnet. On the other hand, a match rubbed on a match-box undergoes a *chemical* change by means of which flame is produced. Thus it is possible to make a distinction between the sciences of physics and chemistry. A chemical change involves some alteration in the essential nature of the substance. The match having been ignited has undergone a permanent change, whereby it is no longer combustible. The physical change quoted above involves no alteration in the substance itself, and the acquired property is further only temporary and can be continually lost and reacquired.

The difficulty occurs in this fact, however, that every chemical change is accompanied by physical change, and the physical change may often be the only sign that chemical change has taken place.

What are the chief divisions of chemistry?

ORGANIC AND INORGANIC CHEMISTRY.—There are two great divisions in the science of chemistry, organic and inorganic. The branch which is best known is that of inorganic chemistry, which covers the chemistry of all the purely mineral substances. Organic chemistry has to do primarily with that of substances obtained from animal or vegetable sources. Now, however, it has resolved itself into the study of the compounds of carbon, always bearing in mind the fact that many carbon compounds have no organic origin, and therefore really fall outside the scope of organic chemistry.

The fundamentals of both branches are the same, and the real reason for the division is the number of the carbon compounds and their

highly complex character. It is in this realm that the graphic formula is of most service, and in its organic branch chemistry most nearly approaches biology.

The branch of inorganic chemistry which treats of the composition, etc., of naturally occurring minerals, receives the title of *mineralogical chemistry.*

Physical Chemistry explains processes, formulates laws for these processes, and is divided within itself again into electro-chemistry and thermo-chemistry, etc. One branch of physical chemistry in which great strides have been made, is the study of the general properties of gases. But it is really as much in the realm of physics as it is in the realm of chemistry.

The study of the chemical nature of substances entering into the constitution of the animal organism, and the chemical changes taking place during the life processes of animals, forms the domain of *physiological chemistry.*

The investigation of the influence of soils, and manures, etc., of different compositions, upon vegetable life, and the chemical principles underlying the art of agriculture, are included in the province of *agricultural chemistry.*

Pharmaceutical chemistry deals with the nature and mode of preparation of the various drugs, ointments, etc., employed for medicinal purposes.

The science in its relations to the arts, manufactures, and industrial processes is embraced in the wide titles of *technical* and *applied chemistry.*

What is the difference between theoretical and practical chemistry?

There are in every science two great divisions. These are known as the "theory" and the "practice" (or, as they are sometimes called, the science and the art). The theory of any science is that part of it which forms the answer in any case to the question "Why?" The practice in the same way answers to the question "How?"

If we find, for example, that by putting a fire under a vessel of water, the water gradually begins to boil, as we say, "boils away," we have learned something that relates to *practice.* We have learned how to change water into vapor. It is not necessary that we should know why the result is brought about, so long as we are satisfied with the result alone.

But as soon as we begin to wish to bring about any result in the best possible way, we must inquire why a certain course of action causes the result; and in the case of the water, we ask why heat should make water boil and then disappear. The answer to the question "How?" is usually a simple one. It can be found out by experiment. Once having found out, we may usually repeat the work as often as we choose.

But the question "Why?" lies deeper, and sometimes cannot be answered at all. The answer to it is in all cases merely a guess—an attempt to explain more or less fully and satisfactorily. If we find that our explanation or theory makes it possible to foretell what will happen in new cases, then we may safely trust it and believe in it.

Give a clear, succinct outline of the essentials of theoretical chemistry.

The whole matter of molecules and atoms is one of *theory.* None of our senses can enable us to know directly either molecules or atoms. We can only imagine that they exist, and then give reasons why their existence makes clear to us the action of elements or of compounds one upon the other.

But in a course of descriptive chemistry, a good knowledge of theoretical chemistry is necessary in order to fully understand all that will be taken up.

THEORETICAL CHEMISTRY

(1) Definitions.—An element is a substance that *cannot* be decomposed.

A compound is a substance that *can* be decomposed into other different substances; and if the decomposition goes far enough, these substances will be elements.

A mixture is made up of two or more components (elements and compounds or both), *physically* put together. It differs from a compound whose compounds are *chemically* united.

(2) Laws.—*Law of Definite Proportions:* All specimens of a compound contain the same elements in the same proportions.

Law of Multiple Proportions: When two compounds consist of the same elements, the proportion of one is a simple multiple of the proportion of the other.

Law of Combining Proportions: Each element enters into all its compounds by a fixed proportional weight.

The fundamental laws of chemistry are proved by experiment.

(3) The Atomic Theory.—The atomic theory teaches that matter is composed of minute particles which themselves cannot be divided, but which unite to form molecules which can be divided.

A *molecule,* then, is the smallest amount of a substance that can exist in a free state.

The diameters of molecules have been ascertained by Jeans to be—

Hydrogen	20.3
Nitrogen	29.1
Oxygen	27.3

These figures express number of billionths of a meter.

An *atom* is an indivisible particle of an element, and goes to make up the molecule.

(4) Chemical Notation.—The symbols used to represent the different elements (*e.g.* H for hydrogen, O for oxygen, etc.), when used in chemical compounds, refer to the number of atoms which go to make up the molecule of that particular compound. For example, the expression H_2SO_4 means that in one molecule of that acid there are 2 atoms of hydrogen, 1 of sulphur, and 4 of oxygen.

(5) Molecular Weights.—To determine the molecular weight of a compound it is necessary to know *Avogadro's Law:* Equal volumes of all gases under the same conditions contain the same number of molecules; and Molecular Weight = Vapor Density × 2.

(6) Reactions.—A reaction or chemical equation is a method of representing a chemical change.

In chemistry we have three kinds of reactions, namely:

(1) *Analytical* reaction, which is the breaking up of compound bodies into simple, *e.g.*, H_2CO_3 can be broken up into its components, H_2O and CO_2, *e.g.*, $H_2CO_3 = H_2O + CO_2$.

(2) *Synthetical* reaction is the building up of a compound body by the union of two or more simple bodies, *e.g.*, $H_2+O=H_2O$ and $H+Cl=HCl$.

Metathetical reaction consists in the interchange of two radicals in two substances, *e.g.*, $2HCl+Zn=ZnCl_2+H_2$. Here the H of the acid is replaced by the Zn.

$KCl+AgNO_3=AgCl+KNO_3$. Here the Ag and the K change places.

(7) THE CHEMICAL ARITHMETIC by which from the molecular weights of two substances, and the weight of one substance we are enabled to get the weight of the required substance is called Stoichiometry.

EXAMPLE: Required the amount of zinc necessary to generate 10 grams of hydrogen.

Atomic weights of H, Cl, and Zn are respectively 1, 35.5, and 65.3.

The reaction is as follows:—

$Zn+2HCl=ZnCl_2+H_2$, and shows that 2 atoms of H are used for every 1 of Zn.

(Mol.Wt.Zn.) (Mol.Wt.H_2) (Wt.Zn.) (Wt.H_2.)

65.3 : 2 = x : 10

$$\frac{65.3\times 10}{2} = x = 326.5 \text{ grams of Zn.}$$

(8) BERTHOLLET'S LAW.—Berthollet established the following law, which is of great importance. When two substances can form a substance insoluble or volatile, under the condition of the reaction, that substance will be formed till one of the factors is exhausted.

(9) RADICALS.—A radical is an atom or group of atoms which changes places in a reaction. A compound radical is made up of different sorts of radicals, as NH_4.

A basic radical is a metal, or a compound radical which behaves like a metal, *e.g.*, Zn and NH_4.

(10) HYDRATES.—A hydrate is a substance formed from water by replacing half of its hydrogen by a radical, *e.g.*, $H_2O+2Na=2NaOH+H_2$, where the sodium has taken the place of one atom of hydrogen.

(11) BASE.—If a hydrate is formed by a basic radical, the hydrate is called a base, *e.g.*, ZnO_2H_2.

(12) ALKALI.—An alkali is a soluble base, *e.g.*, NaOH, KOH, NH_4OH, LiOH.

(13) ACID.—An acid is a substance containing hydrogen which may be replaced by a basic radical, *e.g.*, $2HCl+Zn=ZnCl_2+H_2$.

(14) SALTS.—A salt is a substance formed from an acid replacing its hydrogen by a basic radical, *e.g.* $2HCl+Zn=ZnCl_2+H_2$.

An acid salt is a compound derived from an acid which has not all of its hydrogen replaced, *e.g.*, $2NaCl+H_2SO_4=NaHSO_4+HCl+NaCl$.

(15) CHEMICAL NOMENCLATURE.—*Termination* "—UM" is now applied to all *Metals*, though the older-known metals retain the former names, *e.g.*—Aluminium, Tellurium, etc.

Termination "—IDE" denotes a *Binary Compound*, that is, a substance composed of only two elements, *e.g.*, Sodium Chloride (NaCl).

Termination "—OUS" is applied to the first of two elements when it exists in a greater proportion than in another combination with the same element, *e.g.*, one atom of phosphorus and three atoms of chlorine form *Phosphorous Chloride*.

Termination "—IC," when the first exists in a lesser proportion, *e.g.*, one atom of phosphorus with five atoms of chlorine form *Phosphoric Chloride*.

Prefixes "MONO—," "BI—," "TRI—," etc., indicate the proportion of the latter of two elements, and are sometimes used instead of the above termination. Thus phosphorous chloride may also be called *Phosphorous Tri-Chloride;* so one atom of carbon with one atom of oxygen is *Carbon Monoxide.*

Prefix "HYPO—" (under) and "PER—" (over), specify compounds formed by the same two elements containing less (or more) of an element than is in the usual compound.

Nomenclature of Salts.—From the common acids we get the following salts:—

HCl	forms chlorides.
HNO_3	forms nitrates.
H_2SO_4	forms sulphates
H_2S	forms sulphides
H_2CO_3	forms carbonates.
H_2O	forms no salts.
H_2SiO_4	forms silicates.
H_3PO_4	forms phosphates.

A rough rule for the nomenclature of acids may be made from the above. Acids with the prefix *hydro* and the suffix *ic* form salts in *ide;* with suffix *ate*, salts in *ate;* with suffix *ous*, salts in *ite.*

(16) BASICITY.—The basicity of a substance is measured by the amount of hydrogen which it contains that can be replaced by a basic radical, *e.g.*, H_2SO_4 is di-basic, *i.e.*, the two atoms of hydrogen can be replaced by a basic radical. $H_2SO_4+CaCl_2=CaSO_4+2HCl$.

(17) QUANTIVALENCE.—The quantivalence of an element is measured by the number of atoms of hydrogen it combines with or replaces. *E.g.*, Na is univalent, for when added to HCl it replaces one atom of hydrogen; Ca is bivalent, for, as seen in the above reaction, it replaces two atoms of hydrogen.

(18) TEST FOR A CHLORIDE.—To test for HCl or any chloride, add to the solution to be tested a little $AgNO_3$, and if a chloride is present, a milky-white precipitate will be formed. The reaction is as follows: $HCl+AgNO_3=AgCl$ (white precipitate)$+HNO_3$. A metal almost invariably changes places with hydrogen.

Caution.—In diluting H_2SO_4 add the acid to the water; for the evolution of heat from the process will cause the water to boil, and reversing this process will cause the liquid to boil over and possibly result disastrously.

(19) IMPURITY IN H_2SO_4.—Commercial sulphuric acid contains $PbSO_4$ as an impurity. This gives it the colored appearance, plumbic sulphate being soluble in strong sulphuric acid.

(20) H_2S.—Sulphuretted hydrogen is somewhat soluble in water, slightly poisonous, and is a reducing agent.

(21) CARBONIC ACID.—H_2CO_3 does not exist as an acid. We infer its existence from the presence of its salts. $Na_2CO_3+2HCl=2NaCl+H_2CO_3$, but the H_2CO_3 is so unstable that it breaks up at once into H_2O and CO_2.

(22) TEST FOR A CARBONATE.—To test for a carbonate, treat the substance with an acid; CO_2 is formed; pour the gas into a solution of lime-water, and a white insoluble precipitate is formed, $CaCO_3$.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS

The *Chemical Elements* are the simplest known constituents of all compound substances. Chemists regard them as elements or elementary substances only when they have been proved to be *not* compound. The elements are somewhat arbitrarily divided into metals and non-metals, the former constituting by far the larger class. Several elements occupy positions on the border line. Below is a list of the elements at present known with certainty, and of their atomic weights as fixed by the various kinds of evidence obtained by very numerous, and in many cases varied, experiments. The values are all referred to oxygen as standard with atomic weight 16, and are those adopted, for 1910, by the International Commission on Atomic Weights. The standared O = 16 has been pretty generally adopted by chemists as, upon the whole, more satisfactory than H = 1.

Abbreviations.—At. wt., atomic weight; S. G., specific gravity; M. P., melting point; B. P., boiling point; C. T., critical temperature.

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Aluminum. Symbol Al. At. wt. 27.1. Valence III. S. G. 2.7. M. P. 658°. B. P. 1800°.	Occ.—cryolite AlF_3, $3NaF$; bauxite, impure $Al(OH)_3$; in feldspars, micas and clay; emery, ruby, sapphire (Al_2O_3). Prep.—com'l, by electrolysis of Al_2O_3, from bauxite, dissolved in cryolite, water-power usually furnishing the electrical energy. Prop.—silver-white, ductile, malleable at 120°, tensile strength (wrought) 16 tons per sq. in. A better conductor of electricity, weight for weight, than copper. Molten metal not mobile enough to make castings. It turns badly in the lathe. Acted upon by dil. hydrochloric acid, slowly by sulphuric, but not by nitric or the acids occurring in foods. Soluble in alkaline hydroxides. The tarnishing action of moist air soon comes to an end as the tarnish acts as an adherent protective coating.	Used for cooking utensils, boat-building, military accouterments and small articles requiring lightness and strength; for electric leads. The powdered metal is used as a body for paint; and its mixture with ferric oxide, called thermite, is used for producing very high temperatures (up to 3700°C.) for welding rails, etc. Many metals are reduced from their oxides by means of Al, hence its use in casting steel. Aluminum bronze (10% Al), rolled, has tensile strength of 40 tons per sq. in. Its sulphate forms alums, e. g., $KAl(SO_4)_2$, $12H_2O$, common alum.
Antimony. Symbol Sb. At. wt. 120.2. Valence III. and V. S. G. 6.6. M. P. 630.7°. B. P. 1440°.	Occ.—free, and as stibnite (Sb_2S_3). Prep.—roasting stibnite gives Sb_2O_4, which is then reduced by heating with carbon. Prop.—white, brittle, crystalline metal. Its alloys expand on solidification, and therefore give very sharp castings, e. g., for type. It does not tarnish, but may be burned in air, and unites directly with the halogens.	The metal is a constituent of the alloy type metal, Britannia metal and Babbitt metal (used for bearings). Its oxide (Sb_2O_3) is both basic and acidic. The trichloride, butter of antimony ($SbCl_3$), is easily hydrolyzed. Tartar emetic ($SbOKC_4H_4O_6$) is used in medicine and in dyeing.
Argon. Symbol A. At. wt. 39.86. Valence nil. Density 39.9 (oxygen =32). B. P. —186°. M. P. —190°.	Present in the air 0.94% by volume. To isolate, air is freed from CO_2 by soda-lime, water by P_2O_5, oxygen by red-hot copper, nitrogen by magnesium and calcium. From the residual mixture argon is obtained by fractional distillation.	Forms no compounds, hence its name—does no work. Is a monatomic gas and is identified by its characteristic spectrum seen by examining the light emitted when the gas is placed in a vacuum tube at low pressure and sparked. More soluble in water than nitrogen, 100 vols. water dissolving 4 vols. argon under ordinary conditions.
Arsenic. Symbol As. At. wt. 74.96. Valence III. and V. S. G. 5.7. B. P. 616°(sublimes). M. P. above 800° (under pressure).	Occ.—free, as arsenical pyrites (FeSAs), as orpiment (As_2S_3) and as realgar (As_2S_2). Prep.—by heating arsenical pyrites, FeSAs—FeS + As. Prop.—a steel-gray, dully-metallic and crystalline element classed as a metalloid because intermediate between metals and non-metals. Its vapor has a density corresponding to As_4 at 644°, and to As_2 at 1700°. It burns in air and unites directly with the halogens, sulphur and with many metals.	Used for hardening lead for shot. All its compounds are poisonous. White arsenic (As_2O_3) is partly basic, forming a chloride and partly acidic, forming arsenites. Scheele's green ($CuHAsO_3$) is a pigment dangerous in wallpapers. Traces of arsenic are detected by Marsh's test, in which the intensely poisonous arsine (AsH_3) is formed.
Barium. Symbol Ba. At. wt. 137.37. Valence II. S. G. 3.8. M. P. 850°.	Occ.—as barytes or heavy-spar ($BaSO_4$), and as witherite ($BaCO_3$). Prep.—by electrolysis of the fused chloride. Prop.—a silver-white, lustrous, malleable metal harder than lead. Like calcium, it acts slowly on water to give barium hydroxide and hydrogen. The vapors of its compounds impart a green color to the Bunsen flame.	The peroxide (BaO_2) is used in the manufacture of oxygen and of hydrogen peroxide. The nitrate and chlorate in pyrotechny to give green fires. The sulphate as the body for a permanent white paint and for filling glazed paper. All soluble compounds are poisonous.
Bismuth. Symbol Bi. At. wt. 208.0. Valence III.(and V.). S. G. 9.8. M. P. 270.9°. B. P. 1420°.	Occ.—free and as trioxide (Bi_2O_3) and trisulphide (Bi_2S_3). Prep.—the ore is roasted and then heated with charcoal and metallic iron (to remove traces of sulphur.) Prop.—an exceedingly brittle, crystalline shining metal, white with a tinge of pink. Bismuth expands on solidification. It does not tarnish, but can be burnt in air. Dissolves in oxygen acids.	Used for making fusible alloys, e. g. Wood's metal, M. P. 60.5°, which are used in plugs of fire sprinklers and boiler safety valves, and for taking casts. The oxynitrate is used in medicine and as a cosmetic.
Boron. Symbol B. At. wt. 11.0. Valence III. S. G. (amorph.) 2.4; (cryst.) 2.5. B. P. 3500° (sublimes).	Occ.—as boric acid (H_3BO_3), borax ($Na_2B_4O_7$, $10H_2O$), colemanite ($Ca_2B_6O_{11}$,$5H_2O$). Prep.—amorphous boron by reducing B_2O_3 with Mg. Impure cryst. boron by reducing B_2O_3 with excess of Al. Prop.—amorphous boron is a greenish-black powder that burns in air at 700°, forming B_2O_3 and also BN. It is oxidized, by hot conc. sulphuric or nitric acids, to boric acid.	The compounds are analogous to those of silicon. Borax is used as a flux, and, in solution, as a mild alkali on account of its hydrolysis. Boric acid is used as a weak antiseptic and preservative.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Bromine. Symbol Br. At. wt. 79.22. Valence I. S. G. 3.1. B. P. 59°. M. P. —7.3°.	Occ.—in seawater as alkali bromide, and in the upper layers of salt deposits as sodium and magnesium bromide. Prep.—by treatment of the brines with sulphuric acid and manganese dioxide, or else with chlorine. Prop.—a dark red liquid, smelling like chlorine, whose vapor irritates eyes, throat and nose. Dissolves in thirty parts of water (bromine water). Combines directly with most other elements, but less vigorously than chlorine.	Potassium bromide is used in medicine, silver bromide in photography. Bromine is used in course of the preparation of organic dyes.
Cadmium. Symbol Cd. At. wt. 112.40. Valence II. S. G. 8.6. M. P. 320.9. B. P. 766°.	Occ.—in association with the zinc ores, as carbonate and sulphide. Prep.—in the distillation of impure zinc, the cadmium comes over in the first portions. Prop.—a silver-white metal, more ductile and malleable than zinc. It burns in air, and is attacked by dilute acids.	All the compounds are poisonous, and little ionized. The sulphide (CdS) is the basis of "cadmium yellow." The iodide is used in medicine.
Caesium. Symbol Cs. At. wt. 132.81. Valence I. S. G. 1.9. M. P. 26.3°. B. P. 670°.	Occ.—in certain micas, and in the ashes of certain plants. Prep.—by heating the hydroxide (CsOH) with magnesium. Prop.—a white, silvery metal resembling potassium. It is one of the most active of metals, and decomposes water violently.	The compounds are characterized by giving, especially, two bright lines in the blue of the spectrum (caesius sky-blue).
Calcium. Symbol Ca. At. wt. 40.07. Valence II. S. G. 1.55. M. P. 803°.	Occ.—as carbonate (Iceland spar, calcite, aragonite, marble, chalk, limestone), sulphate (gypsum), phosphate (apatite), fluoride (fluor spar), and as complex silicates in great variety (feldspars, pyroxenes, amphiboles, etc.). Prep.—by electrolysis of the fused chloride. Prop.—a white crystalline metal, harder than lead, that can be cut, drawn, rolled and turned. It attacks water, and burns in the air at a red heat, forming the oxide (CaO) and the nitride (Ca_3N_2). It unites with hydrogen to CaH_2, whose action on water is a source of hydrogen for balloons.	Calcium oxide (quicklime) is used for mortar and to remove hair from hides. The hydroxide [$Ca(OH)_2$] mixed with sand forms mortar; its solution is limewater. Plaster of paris, a less hydrated sulphate, takes up water on setting to form $CaSO_4,2H_2O$. The phosphates are fertilizers. Bleaching powder is CaClOCl and calcium carbide is CaC_2. Common glass contains silicates of calcium and sodium.
Carbon. Symbol C. At. wt. 12.005. Valence IV. S. G. diamond 3.5: graphite 2.3: amorphous 1.9 M. P.—not realized; estimated at 4400°	Occ.—as diamond and graphite, in the free state; in combination with hydrogen as petroleum, with oxygen as carbon dioxide in the air, with these and other elements as coal, and in plant and animal tissues; and as many carbonates. Prep.—by dry distillation of wood or coal, yielding charcoal and coke respectively. Prop.—diamond is crystalline and the hardest of minerals, the dark-colored "bort" being used for cutting and grinding. Graphite has a black metallic luster, is crystalline and may be scratched by the finger-nail. Charcoal is amorphous, and possesses the power of absorbing gases and also coloring matters. All three forms burn in oxygen to produce carbon dioxide.	The carbon compounds form the subject of "Organic Chemistry." Carbon dioxide results from the burning of coal, coke, wood, oil or illuminating gas; from fermentation and decay, which are slow burnings; and is exhaled in the breath. Carbon monoxide, arising from recently-stoked fires, is an exceedingly poisonous gas.
Cerium. Symbol Ce. At. wt. 140.25. Valence III., IV. (and VI.). S. G. 6.8; M. P. 623°	Occ.—as silicate in cerite, along with Nd, Pr and La; also in monazite sand. Prep.—by electrolysis of the fused chloride. Prop.—a metal with the color and luster of iron, like tin in hardness, and very ductile and malleable. Burns in air more easily and brightly than magnesium.	Welsbach incandescent gas mantles contain one per cent of cerium dioxide, CeO_2.
Chlorine. Symbol Cl. At. wt. 35.46. Valence I. (and VII.). S. G. (liquid) 1.3. M. P. —101° B. P. —33.6°. C. T. +146°.	Occ.—in seawater as chlorides of the alkalis and alkaline earths, and as like compounds in salt deposits. Prep.—by electrolysis of alkali chloride, fused or in solution; or by the action of manganese dioxide on hydrochloric acid. Prop.—a greenish-yellow gas of characteristic odor, with a violent action on the respiratory tract. Unites directly with all elements save oxygen, nitrogen and the argon family. Displaces bromine and iodine from bromides and iodides, and substitutes hydrogen in organic compounds.	The gas is used in extracting gold and in preparing bleaching and disinfecting agents. In presence of water it bleaches many coloring matters. Forms chlorides (as NaCl, HCl, $CaCl_2$), hypochlorides [as solution of $Ca(OCl)_2$], chlorates (as $KClO_3$, used for matches and in pyrotechny), and perchlorates (as $KClO_4$).
Chromium. Symbol Cr. At. wt. 52.0. Valence II., III. and VI. S. G. 6.6. M. P. 1515°. B. P. 2200°.	Occ.—as chromite [$Fe(CrO_2)_2$]. Prep.—by reducing Cr_2O_3 with aluminium filings. Prop.—a steel-gray, lustrous, brittle and very hard metal. At high temperatures it burns in air to green Cr_2O_3. It is attacked by dilute sulphuric or hydrochloric acid, but not by nitric acid.	The alloy ferrochromium is used in steel-making. Chrome green, the pigment, is Cr_2O_3. Chrome yellow is $PbCrO_4$. Bichromates (as $K_2Cr_2O_7$) are used in photo-processes, tanning and dyeing and as oxidizing agents, e.g., in batteries.
Cobalt. Symbol Co. At. wt. 58.97. Valence II. and III. S. G. 8.6. M. P. 1490°.	Occ.—as smaltite ($CoAs_3$) and cobaltite (CoAsS). Prep.—by igniting the oxide in hydrogen. Prop.—a white, magnetic, malleable metal, less tenacious than iron. By exposure it turns pinkish. It is less active chemically than iron.	Its intensely blue silicates are used in coloring porcelain and constitute the pigment smalt.
Columbium (Niobium) Symbol Cb. At. wt. 93.5. Valence I., II., IV. and V. S. G. 12.7. M. P. 1950°.	Occ.—in the mineral columbite. Prep.—by reduction of CbO_2 by paraffin. Prop.—a light-gray, malleable and ductile metal, as hard as wrought iron, which is not affected by acids, even by aqua regia.	The hydride (CbH) burns in air. The compounds occur with those of tantalum, which they closely resemble.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Copper. Symbol Cu. At. wt. 63.57. Valence I. and II. S. G. 8.9. M. P. 1083°. B. P. 2310°.	Occ.—free, as cuprite (Cu_2O), copper glance (Cu_2S), chalcopyrite (Cu_2S, Fe_2S_3), malachite [$CuCO_3$, $Cu(OH)_2$]. Prep.—after removal of iron and sulphur, the oxide is reduced by heating with carbon. It is refined electrolytically. Prop.—a red, lustrous, very ductile and malleable metal of tensile strength fourteen tons per square inch, second only to silver in electrical conductivity. In ordinary air it gradually becomes coated with basic carbonate. In absence of air, nitric acid alone among the dilute acids attacks it, but in presence of air even the acids found in foodstuffs can dissolve it.	The metal is used for coins, electroplating, electric leads, roofing, cooking vessels and for making alloys, such as brass, bell and gun metals, German silver and the bronzes. The soluble compounds are poisonous, and are therefore used as germicides in agriculture. Blue vitriol is $CuSO_4 5H_2O$; the basic acetate is verdigris.
Dysprosium. Symbol Dy. At. wt. 162.5. Valence III.	Occ.—in monazite, gadolinite, etc. Prep.—not yet isolated. Prop.—the oxide dysprosia, along with three other rare earths, constitutes erbia.	The salts are green or yellow in color and show characteristic absorption bands.
Erbium. Symbol Er. At. wt. 167.7. Valence III. S. G. 4.8.	Occ.—same as for dysprosium. Prep.—not yet isolated pure. Prop.—crude erbia has been separated into erbia, holmia, thulia, and dysprosia.	The salts are rose-colored, and show characteristic absorption spectra.
Europium. Symbol Eu. At. wt. 152.0. Valence III.	Occ.—in monazite and other rare minerals. Prep.—not yet isolated. Prop.—this element so closely resembles samarium that the analytical separation of the two is difficult.	The salts are pinkish and show a faint absorption spectrum.
Fluorine. Symbol F. At. wt. 19.0. Valence I. S. G. (liquid) 1.11 at —187°. M. P. —223°. B. P. —187°.	Occ.—as cryolite (AlF_3, $3NaF$), fluor spar (CaF_2) and very widely elsewhere in small quantities. Prep.—by electrolysis of dry hydrogen fluoride at —23°. Prop.—a pale yellowish-green gas that unites with every element excepting oxygen and the argon family. It rapidly displaces oxygen from water or chlorine from hydrogen chloride.	Hydrogen fluoride is used for etching glass and in silicate analysis. Silver fluoride is soluble and calcium fluoride insoluble, in contrast with the other halides of these metals.
Gadolinium. Symbol Gd. At. wt. 157.3. Valence III.	Occ.—in gadolinite and samarskite. Prep.—not yet isolated. Prop.—This element closely resembles terbium in its compounds.	The salts are colorless and show no absorption bands.
Gallium. Symbol Ga. At. wt. 69.9. Valence III. S. G. 5.9. M. P. 30.1°.	Occ.—in zinc blende and in bauxite. Prep.—by electrolysis of a suitable solution of its salts. Prop.—a bluish-white, tough metal that may be cut with a knife. Like aluminium, it is soluble in hydrochloric acid and in caustic alkali, but not in nitric acid.	It forms two chlorides ($GaCl_3$ and $GaCl_2$) which yield spark spectra very characteristic of gallium.
Germanium. Symbol Ge. At. wt. 72.5. Valence II. and IV. S. G. 5.5. M. P. 958°.	Occ.—in the rare mineral argyrodite. Prep.—by the reduction of the dioxide (GeO_2) by carbon. Prop.—a grayish-white, brittle, lustrous metal, insoluble in hydrochloric acid. It combines directly with the halogens.	The close relation of this element to carbon and silicon is shown in the compound germanium chloroform ($GeHCl_3$).
Glucinum (or Beryllium). Symbol Gl. At. wt. 9.1. Valence II. S. G. 1.7. M. P. below 960°.	Occ.—in beryl [$Al_2Gl_2(SiO_3)_6$]. Prep.—by electrolysis of the fused double fluoride, $GlF_2,2KF$. Prop.—a hard, white metal that tarnishes when heated in air, and is soluble in dilute acids when powdered.	Its hydroxide [$Gl(OH)_2$] is feebly acidic as well as basic, thus resembling the hydroxide of zinc. Emerald is beryl colored green by chromium.
Gold. Symbol Au. At. wt. 197.2. Valence I. and III. S. G. 19.32. M. P. 1062.4°.	Occ.—chiefly free, but also as telluride; many specimens of iron pyrites are auriferous. Prep.—from gold-bearing sands by washing away the lighter material, and dissolving the gold from the residue by mercury, which is subsequently separated from the gold by distillation. Quartz ores are pulverized in stamping mills, and the powder is then carried by water over amalgamated copper plates on which the gold collects. Prop.—a soft, bright-yellow metal, easily scratched by the knife, an excellent conductor of heat and of electricity. The most ductile and the most malleable of all the metals. Chemically, gold is rather inert, and is not attacked by the oxygen of the air, by hydrogen sulphide, nor, indeed, by any single one of the common acids. It is attacked by fused alkalis, yielding aurates, and by aqua regia, yielding chlorauric acid ($HAuCl_4$).	Pure gold is called 24-carat gold. American, French and German gold coins are 21.6 carat, while British sovereigns are 22 carat, the balance in all these cases being copper. Jewelry is made in 18, 14, 9, etc., carat gold, the addition of copper increasing the hardness and rigidity. Sodium chloraurate ($NaAuCl_4$) is used for "toning" in photography, while potassium auricyanide [$KAu(CN)_4$] is used in electrogilding.
Helium. Symbol He. At. wt. 4.00. Valence 0. S. G. (liquid at B.P.) 0.122. M. P. 272°. B. P. —268.7°.	Occ.—in air to the extent of one to two volumes per million; also occluded in certain minerals. Prep.—neon and helium are boiled off crude argon, and the neon solidified by cooling. Prop.—the lightest gas after hydrogen, transparent, odorless and colorless, very inert, forming no compounds with other elements.	It is one of the decomposition products of certain other (radio-active) elements.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Holmium. Symbol Ho. At. wt. 163.5. Valence III.		
Hydrogen. Symbol H. At. wt. 1.008. Valence I. S. G. (liquid at B.P.) 0.07. M. P. —259°. B. P. —252.5°.	Occ.—in air to the extent of one volume per 20,000 volumes air; combined, in water (11.19% by weight) natural gas, petroleum and all animal and vegetable bodies. Prep.—by treating zinc with hydrochloric or sulphuric acid; by electrolysis of water. Prop.—the lightest gas, transparent, odorless and colorless, soluble in water (2 volumes in 100 volumes water under everyday conditions), in platinum, in palladium (502 volumes in 1 of pd). Burns in air and in chlorine, and unites with many of the other elements.	Its two oxides are water (H_2O) and hydrogen peroxide (H_2O_2), the latter of which is used in solution as a bleaching agent. Every acid contains hydrogen as an essential constituent. Its compounds with carbon and other elements number over 100,000. Hydrogen gas is used for the oxyhydrogen flame and for filling balloons.
Indium. Symbol In. At. wt. 114.8. Valence III. and I. S. G. 7.3. M. P. 155°.	Occ.—in zinc blende (ZuS). Prep.—electrolytically from solutions of its salts. Prop.—a white metal, malleable and softer than lead.	Its compounds color the nonluminous gas flame blue and show a characteristic blue line in the spectrum.
Iodine. Symbol I. At. wt. 126.92. Valence I., V. and VII. S. G. 4.94. M. P. 114°. B. P. 184°.	Occ.—in the ocean, in certain seaweeds, and in Chili saltpeter, always in the combined state. Prep.—from iodides by displacement of their iodine by chlorine. Prop.—a dark gray, brittle solid with a metallic luster. Its vapor is violet, as are its solutions in chloroform and in carbon bisulphide. It requires over 5,000 parts of water for its solution. Combines directly with many elements, but is much less active than chlorine and bromine.	Its tincture is used in medicine as a counterirritant. Potassium iodide (KI) and iodoform (CHI_3) likewise find application in medicine. The alkyl iodides (e.g., C_2H_5I) are much used in synthetic organic chemistry.
Iridium. Symbol Ir. At. wt. 193.1. Valence III. and IV. S. G. 22.4. M. P. 2300°.	Occ.—along with platinum. Prep.—by a complex series of operations from platinum ores. Prop.—a white metal, brittle when cold, and very hard. It is attacked by fused alkalies, but not by aqua regia.	It is used for pointing gold pens. Its alloy with nine parts of platinum is used for standard meter bars on account of its inalterability.
Iron. Symbol Fe. At. wt. 55.85. Valence II. and III. S. G. 7.86; pig 7.03 to 7.73. M. P. 1515°. B. P. 2450°. wrought 1100°-1500°. steel 1375°. gray pig 1275°. white pig 1075°.	Occ.—as magnetic oxide (Fe_3O_4), hematite (Fe_2O_3), limonite ($2Fe_2O_3,3H_2O$), siderite ($FeCO_3$), which are important ores; iron pyrites (FeS_2); in rocks as complex silicates, and in plants and animals. Prep.—pig iron is prepared in the blast furnace by reduction of the ore by means of carbon monoxide in presence of a suitable flux. From pig iron, wrought iron is obtained by puddling, and steel by the Bessemer, Siemens-Martin or other process. Prop.—a white, malleable, ductile, magnetic metal, unchanged in dry air or air-free water, but rusting in moist air. Easily attacked by dilute acids, but not by fused alkalies. Cast iron contains 2 to 5% of carbon and other impurities, and is hard and brittle. Wrought iron contains less than 0.2% of carbon, and is softer and tougher, with a tensile strength of 22 to 25 tons per square inch. Steel contains from 0.2 to 1.5% of carbon, is permanently magnetic, may be tempered, and possesses tensile strength up to 100 tons per square inch.	The metal is used as a structural material, for rails, machinery, tools, etc. Jeweler's rouge and Venetian red consist of the oxide (Fe_2O_3). Rust is chiefly the hydrated oxide (FeO, OH). Hammer scale and loadstone have the composition Fe_3O_4. Ferric chloride ($FeCl_3$), ferrous iodide (FeI_2) and other iron compounds are used in medicine. Green vitriol ($FeSO_4,7H_2O$) is used in making ink, and in dyeing. Potassium ferrocyanide [$K_4Fe(CN)_6$] is used for making Prussian blue, potassium cyanide, etc.
Krypton. Symbol Kr. At. wt. 82.92. Valence 0. S.G. (Liquid at B.P.)2.2 M. P. —169°. B. P. —152°.	Occ.—in minute quantity in the air. Prep.—from crude argon by fractional distillation. Prop.—an inert, colorless, odorless gas, resembling, but denser than, argon.	It forms no compounds, and is identified by its characteristic spectrum.
Lanthanum. Symbol La. At. wt. 139.0. Valence III. and V. S. G. 6.15. M. P. 810°.	Occ.—as lanthanite [$La_2(CO_3)_3,8H_2O$]. Prep.—by electrolysis of fused $LaCl_3$. Prop.—an iron-gray metal tarnishing in air to steel-blue; malleable and ductile. Attacked slowly even by cold water.	When heated in air it forms oxide (La_2O_3) and nitride (LaN).
Lead. Symbol Pb. At. wt. 207.20. Valence II., IV. S. G. 11.4. M. P. 327.2°. B. P. 1525°.	Occ.—as galena (PbS), and in silver ores. Prep.—by calcination of partially roasted galena. Purification is effected by Parkes process. Prop.—a soft, gray metal, malleable, but of low tensile strength. In presence of air, water acts on lead to produce the hydroxide, which being slightly soluble, may cause lead poisoning, if present in water supplies. When heated in air it is oxidized to litharge (PbO), and, under suitable conditions, to minimum (Pb_3O_4).	The metal is used for water pipes, roofs and gutters and storage batteries. For shot it is alloyed with 0.4% of arsenic. Typemetal contains 20% of antimony. Babbitt metal, for bearings, contains over 70% of lead. Solder and pewter are alloys of lead and tin. The basic carbonate [$Pb(OH)_2,2PbCO_3$], "white lead," is the basis of most oil paints.
Lithium. Symbol Li. At. wt. 6.94. Valence I. S. G. 0.53. M. P. 186°. B. P. above 1400°.	Occ.—as a mixed fluoride with aluminium in amblygonite. Prep.—by electrolysis of the fused chloride. Prop.—a silver-white metal, softer than lead, that tarnishes quickly in air, and is easily acted upon by water. When heated, it unites vigorously with nitrogen.	The carbonate [$Li_2(CO_3)$] is used in medicine as a solvent for uric acid, lithium urate being soluble. The lithium salts give a carmine flame coloration.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Lutecium. Symbol Lu. At. wt. 175.0.	Occ.—in euxenite. Prep.—it has not been isolated.	Its compounds resemble those of ytterbium.
Magnesium. Symbol Mg. At. wt. 24.32. Valence II. S. G. 1.75. M. P. 650°. B. P. 1120°.	Occ.—as magnesite ($MgCO_3$), dolomite ($MgCO_3$, $CaCO_3$), carnallite ($MgCl_2$, KCl, $6H_2O$) and in very many complex silicates. Prep.—by electrolysis of dried, fused carnallite. Prop.—a silver-white metal, ductile when hot. It tarnishes in air, and acts slowly upon water, rapidly on steam. Burns in air to the oxide MgO, emitting a very bright light used in photography. It unites directly with nitrogen.	The sulphate ($MgSO_4,7N_2O$) is known as epsom salts and is used in medicine, as are the oxide (magnesia), the carbonates and citrate. Magnalium is a light, hard alloy with aluminum.
Manganese. Symbol Mn. At. wt. 54.93. Valence II., III., IV., VI. and VII. S. G. 7.3. M. P. 1120°. B. P. 1900°.	Occ.—as pyrolusite (MnO_2), beaunite (Mn_2O_3), hausmannite (Mn_3O_4) and manganese spar ($MnCO_3$). Prep.—by heating Mn_3O_4 with aluminum filings. Prop.—a steel-gray, hard, brittle metal with a pinkish tinge. It rusts in moist air and is attacked by dilute acids.	Ferromanganese and spiegeleisen are alloys with iron, used in steel making. With copper it forms the hard, tough manganese bronzes, with tensile strength up to 30 tons per square inch. Impure sodium permanganate ($NaMnO_4$) is used in disinfecting as Condy's fluid.
Mercury. Symbol Hg. At. wt. 200.6. Valence I. and II. S. G. 13.6. M. P. —39.5°. B. P. 356.95°.	Occ.—free and as cinnabar (HgS). Prep.—by roasting cinnabar $HgS + O_2 — Hg + SO_2$. Prop.—a silver-white, mobile liquid with a vapor pressure at 0° of 0.0002 mm. It tarnishes but slowly in air and is attacked only by dilute nitric among the dilute acids. The vapor is monatomic.	It is used for filling thermometers and barometers. Its alloys are called amalgams, some of which are used in dentistry. Calomel (HgCl) is administered internally in medicine; corrosive sublimate ($HgCl_2$) forms a solution with very powerful germicidal properties.
Molybdenum. Symbol Mo. At. wt. 96.0. Valence III., IV., V. and VI. S. G. 10.0. M. P. 2450°.	Occ.—as molybdenite (MoS_2) and wulfenite ($PbMoO_4$). Prep.—by reducing the oxides with aluminum powder. Prop.—a white metal, as malleable as iron, that will not scratch glass. Insoluble in hydrochloric or dilute sulphuric acid.	The ferromolybdenum alloys are used in the manufacture of special steels.
Neodymium. Symbol Nd. At. wt. 144.3. Valence III. and IV. S. G. 7.0. M. P. 840°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride. Prop.—a yellowish metal, tarnishing in air.	The salts are rose-violet in color, and their solutions show characteristic absorption spectra.
Neon. Symbol Ne. At. wt. 20.2. Valence 0. B. P. ca. —243°.	Occ.—in minute quantity in the atmosphere. Prep.—neon and helium are boiled out of crude argon, and the neon separated from helium by cooling with liquid hydrogen. Prop.—a colorless, transparent, odorless, inert gas, resembling argon.	It forms no compounds, and is recognized by its characteristic spectrum.
Nickel. Symbol Ni. At. wt. 58.68. Valence II. and III. S. G. 8.8. M. P. ca. 1452°. B. P. ca. 2600°.	Occ.—as nicollite (NiAs) and nickel glance (NiAsS). Prep.—by igniting the oxalate in hydrogen. Prop.—a white, very hard, lustrous metal, malleable, ductile and tenacious. It rusts but slowly in air, and is attacked easily by only nitric acid.	The metal furnishes a protective coating when plated on iron. German silver is an alloy of nickel, copper and zinc. Nickel steel is used for armor plates. Manganin, containing nickel, copper and manganese, is used for electrical resistances.
Nitrogen. Symbol N. At. wt. 14.01. Valence III. and V. S. G. (liquid at B.P.) 0.81. M. P. —214°. B. P. —194°.	Occ.—free nitrogen forms about four-fifths of air by volume. As Bengal saltpeter (KNO_3), Chili saltpeter ($NaNO_3$); and as an essential constituent of vegetable and animal protoplasm. Prep.—by heating ammonium nitrite, by oxidation of ammonia, etc. Prop.—a colorless, odorless, transparent gas, rather inactive chemically. At ordinary temperature and pressure, 100 volumes of water dissolve 1.5 volumes of nitrogen. It unites directly with strongly heated boron, lithium, calcium and magnesium.	Nitrous oxide (N_2O), or laughing gas, is used by dentists. Nitric acid (HNO_3) has many applications in technical chemistry. Ammonia (NH_3) is a very soluble gas. Ammonium sulphate [$(NH_4)_2SO_4$] and Chili saltpeter are used as nitrogenous manures. Nitrogen is a constituent of the aniline dyes, the proteins and many other important classes of organic substances.
Osmium. Symbol Os. At. wt. 190.9. Valence II., III., IV., VI. and VIII. S. G. 22.477. M. P. 2500°.	Occ.—along with platinum. Prep.—by reducing OsO_4. Prop.—a gray metal, harder than glass, the heaviest of known bodies.	Its alloy with iridium is used in tipping gold pens. Osmium tetroxide (OsO_4) is used as a microscopic stain for fat.
Oxygen. Symbol O. At. wt. 16.00. Valence II. S. G. (liquid at B.P.) 1.13. M. P. —218.4°. B. P. —182.5°.	Occ.—free oxygen forms about one-fifth of air by volume. Water contains 88.88% of oxygen. The rocks of the earth's crust contain about 45% in combination, chiefly as silicates. Prep.—in the laboratory by heating potassium chlorate ($KClO_3$). Commercially, from the air. Prop.—a colorless, odorless, tasteless, transparent gas, slightly heavier than air. At ordinary temperature and pressure, 100 volumes of water dissolve 3 volumes of oxygen. It is very active chemically, combining directly with all but a few of the other elements to form oxides. Sulphur, phosphorus, etc., burn much more vigorously in oxygen than in air. Liquid oxygen is magnetic.	The gas is sold compressed in mild steel cylinders, and is used for the oxyhydrogen blowpipe and in medicine, besides for chemical purposes. It is necessary to support animal respiration and to sustain ordinary combustion. It enters as a constituent into all oxides, most salts and many organic compounds.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Palladium. Symbol Pd. At. wt. 106.7. Valence II. and IV. S. G. 11.9. M. P. 1549°.	Occ.—along with platinum, and with gold in Brazil. Prep.—by a complex series of processes from platinum ores. Prop.—a silvery, malleable and ductile metal, related to platinum, unlike which, however, it is attacked by nitric acid. Under suitable conditions it can take up over 900 volumes of hydrogen.	Since it does not tarnish, it is used for coating silver goods, and by dentists as a substitute for gold.
Phosphorus. Symbol P. At. wt. 31.04. Valence III. and V. S. G. white, 1.82. red, 2.25. M. P. white, 44°. B. P. 289°.	Occ.—as phosphates, such as apatite [$Ca_3F(PO_4)_3$]; in bones, teeth, brain and seeds of plants. Prep.—by reduction of calcium phosphate by carbon in the electric furnace in presence of a suitable flux. Prop.—phosphorus exists in two allotropic modifications: white phosphorus is waxy in consistency, soluble in carbon bisulphide, evil smelling and poisonous; red phosphorus is a solid, insoluble in carbon bisulphide, odorless and not poisonous. White phosphorus has a low ignition temperature, hence its former use in matches.	Red phosphorus is used in the manufacture of matches, as also is the compound P_4S_3. In the form of superphosphate of lime [$CaH_4(PO_4)_2$] phosphorus is an important artificial manure. The chlorides (PCl_3 and PCl_5) are much used in organic chemistry.
Platinum. Symbol Pt. At. wt. 195.2. Valence II. and IV. S. G. 21.48. M. P. 1753°.	Occ.—free, alloyed with the platinum metals, as nuggets in alluvial sands in the Urals, California, etc. Prep.—it is freed from the metals with which it is alloyed by a complex series of processes. Prop.—a silvery, tenacious, ductile and malleable metal, unaltered in moist air and unattacked by any single common acid. Aqua regia, fused alkalies, alkali nitrates and cyanides attack it, however. Platinum "sponge" and "black" are finely divided forms.	On account of its resistance to acids, platinum is much used for chemical vessels. Since platinum has a coefficient of expansion very close to that of glass, platinum wires can be fused through glass without danger of breakage on cooling. The salts are used in photography.
Potassium. Symbol K. At. wt. 39.10. Valence I. S. G. 0.86. M. P. 62.5°. B. P. 762°.	Occ.—as sylvite (KCl), carnallite ($KCl,MgCl_2,6H_2O$); in plant and animal ashes, and in many complex silicates. Prep.—by reduction or by electrolysis of fused potassium hydroxide (KOH). Prop.—a silver-white, lustrous metal, as soft as wax, tarnishing instantly in moist air. Chemically it is a very active metal, decomposing water in the cold and uniting violently with the halogens, sulphur and oxygen.	An alloy with sodium is used in filling high-temperature thermometers. Bengal saltpeter is the nitrate and is used in pyrotechny, for gunpowder and as a preservative. The iodide (KI) is used in medicine. The chlorate, like the nitrate, is used as a source of oxygen in pyrotechny and for match heads. Caustic potash (KOH) has many chemical applications. The cyanide (KCN) is used in gold extraction.
Praseodymium. Symbol Pr. At. Wt. 140.9. Valence III. and IV. S. G. 6.47. M. P. 940°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride. Prop.—a yellowish metal, remaining untarnished in air.	The salts are leek-green in color, and their solutions have characteristic absorption spectra.
Radium. Symbol Ra. At. wt. 226.0. Valence II. M. P. 700°.	Occ.—in minute quantity in pitchblende and other uranium minerals. Prep.—the metal has recently been isolated; the bromide is separated from the barium bromide prepared from pitchblende by fractional crystallization. Prop.—in all of its compounds, the metal has the power of emitting certain radiations. These can pass through matter that is opaque to light, render air a conductor, affect a photographic plate and cause a zinc-sulphide screen to fluoresce visibly.	The rays from radium compounds (such as $RaBr_2$, $RaCl_2$, $RaCO_3$) act destructively on living tissues and on bacteria. One gram of radium in any of its compounds gives off about 100 calories of heat per hour.
Rhodium. Symbol Rh. At. wt. 102.9. Valence II., III. and IV. S. G. 12.1. M. P. 1970°.	Occ.—in the ores of platinum. Prep.—by a complex series of processes from platinum ores. Prop.—a silvery, malleable and ductile metal, not tarnishing in air and not attacked by aqua regia.	The red chloride ($RhCl_3$) is formed by the action of chlorine upon the metal.
Rubidium. Symbol Rb. At. wt. 85.45. Valence I., III. and V. S. G. 1.53. M. P. 38.5°. B. P. 69.8°.	Occ.—the salts are associated with salts of potassium. Prep.—similar to that of potassium. Prop.—a silver-white metal resembling potassium, like which it attacks water vigorously.	The compounds show characteristic flame-spectra, and were recognized as those of a new element spectroscopically by Bunsen.
Ruthenium. Symbol Ru. At. wt. 101.7. Valence III., IV., VI., VII. and VIII. S. G. 12.1. M. P. above 1950°.	Occ.—in the ores of platinum. Prep.—by a complex series of processes from platinum ores. Prop.—a hard, white, brittle metal, oxidized when heated in air, scarcely attacked by aqua regia.	The following oxides are known: Ru_2O_3, RuO_2, RuO_4, as well as salts corresponding to RuO_3 and Ru_2O_7.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Samarium. Symbol Sa. At. wt. 150.4. Valence II. and III. S. G. ca. 7.7. M. P. 1300 to 1400°.	Occ.—in the mineral samarskite. Prep.—by electrolysis of the chloride. Prop.—a whitish-gray metal, tarnishing in air.	The salts are topaz-yellow in color, and are similar to those of lanthanum.
Scandium. Symbol Sc. At. wt. 44.1. Valence III.	Occ.—in the minerals euxenite and gadolinite. Prep.—the metal has not been isolated. Prop.—the existence of this element, whose oxide was discov r d in 1879, was predicted by Mendeléeff in 1869.	The chloride ($ScCl_3$) shows a characteristic spark spectrum.
Selenium. Symbol Se. At. wt. 79.2. Valence II., IV. and VI. S. G. amorphous 4.26. monoclinic 4.47. hexagonal 4.8. M. P. amorphous 50°. monoclinic 170 to 180°. hexagonal 217°. B. P. 688°.	Occ.—free in some specimens of sulphur, and in combination with lead, iron and other metals, as in pyrites. Prep.—(amorphous) by reducing selenious acid (H_2SiO_3) by sulphur dioxide. Prop.—three varieties are known: (1) red amorphous, soluble in carbon bisulphide, from which it is deposited as (2) red translucent monoclinic crystals, soluble in carbon bisulphide, (3) blue-gray metallic selenium, insoluble in carbon bisulphide. This last form conducts electricity many times better when exposed to light, and the better the brighter the light.	Selenium cells are used as indicators of intensity of illumination. The compounds strongly resemble those of sulphur. Hydrogen selenide is an evil-smelling inflammable gas. Selenic acid (H_2SeO_4) is a more powerful oxidizer than sulphuric acid and dissolves gold.
Silicon. Symbol Si. At. wt. 28.3. Valence IV. S. G. amorphous 2.3. crystalline 2.34. M. P. 1458°. B. P. ca. 3500°.	Occ.—silicon dioxide (SiO_2) occurs as flint, quartz, quartz sand, etc. The igneous rocks are composed largely of silicates, and this element constitutes over 25% of the earth's crust. Prep.—by reducing sand with coke in the electric furnace. Prop.—amorphous silicon is a brown powder that burns when heated in air. Crystalline silicon forms black needles. It is less active than the amorphous variety and is attacked only slowly by a mixture of hydrofluoric and nitric acids. It unites with fluorine, however, at ordinary temperatures.	The "pigs" of silicon made at Niagara are used in steel-making. The ornamental varieties of quartz find uses as gemstones, as do several natural silicates. Silicon carbide, "carborundum" (SiC), is used as an abrasive. Sodium silicate solution is "water glass," used to protect sandstone and to preserve eggs. Common glass is a mixture of sodium and calcium silicates.
Silver. Symbol Ag. At. wt. 107.88. Valence I. S. G. 10.53. M. P. 960°. B. P. 1955°.	Occ.—native, as sulphide (Ag_2S) often associated with galena; chloride (AgCl), etc. Prep.—from lead by the Pattison or the Parkes process; from the ores by the Mexican and other processes. Prop.—a white, highly lustrous, tough, very ductile and malleable metal, the best conductor of heat and electricity known. Liquid silver dissolves oxygen. It is unaffected by the oxygen of moist air, and its tarnishing is due to the action of hydrogen sulphide. It dissolves in dilute nitric and in concentrated hot sulphuric acid.	It is employed for articles of use and of ornament and for coinage. U. S. sterling silver contains 90% silver with 10% copper. Lunar caustic is silver nitrate. This salt and the halides of silver are extensively used in photography. For electroplating, a bath of potassium argenticyanide [$KAg(CN)_2$] is used.
Sodium. Symbol Na. At. wt. 23.00. Valence I. S. G. 0.97. M. P. 965°. B. P. 883°.	Occ.—in the sea as chloride (NaCl); in salt deposits as chloride, borate, nitrate; in many complex silicates in rocks. Prep.—by electrolysis of fused sodium hydroxide (NaOH). Prop.—a silver-white metal, as soft as wax, that may be welded at ordinary temperature. Like potassium it is very active, uniting directly with many other elements, and attacking water vigorously in the cold.	The metal is used in the manufacture of several chemicals. Sodium chloride (NaCl) is a necessity of life to most animals; and is used in the manufacture of hydrochloric acid, chlorine and sodium compounds. Sodium carbonate ($NaCO_3,10H_2O$) or washing soda, and sodium hydroxide (NaOH) are used for cleaning, and in the manufacture of soap and chemicals. Baking soda is sodium bicarbonate ($NaHCO_3$). The sulphate (Na_2SO_4, $10H_2O$) is known as Glauber's salt; the thiosulphate, by photographers, as "hypo."
Strontium. Symbol Sr. At. wt. 87.63. Valence II. S. G. 2.55. M. P. ca. 800°.	Occ.—as strontianite ($SrCO_3$) and celestine ($SrSO_4$). Prep.—by electrolysis of the fused chloride. Prop.—a white metal, softer than calcium and harder than sodium, tarnishing to a yellow tint. Like calcium, it is active enough to attack water vigorously in the cold.	The nitrate and chlorate are used in pyrotechny for red fire. All volatile compounds color the Bunsen flame red.
Sulphur. Symbol S. At. wt. 32.06. Valence II., IV. and VI. S. G. rhombic 2.06. monoclinic 1.96. M. P. rhombic 112.4°. monoclinic 119°. B. P. 444.9°.	Occ.—native, in combination with most metals as sulphides, and with some metals as sulphates. Prep.—by melting the free sulphur away from the rocky matrix, and subsequent purification by distillation. Prop.—natural sulphur is rhombic in crystalline form, yellow, brittle, of vitreous luster, and a poor conductor of heat and electricity. This and the monoclinic variety are soluble in carbon bisulphide, while amorphous sulphur is not. When heated, sulphur unites directly with most of the other elements.	Sulphur is used to prepare sulphur dioxide (SO_2), which is used in making sulphuric acid and sulphites, and for bleaching; also for vulcanizing rubber and in the manufacture of black gunpowder, fireworks and matches. Sulphuric acid (H_2SO_4) is to chemical industry what iron is to engineering.

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Tantalum. Symbol Ta. At. wt. 181.5. Valence II., IV. and V. S. G. 16.6. M. P. bet. 2250° and 2300°.	Occ.—in tantalite and many other rare minerals. Prep.—by the action of sodium on sodium tantalofluoride (Na_2TaF_7). Prop.—a hard, silver-white metal, ductile and malleable when hot, of very high tensile strength. The hot metal can absorb 740 volumes of hydrogen. It is not attacked by aqua regia.	The metal is used for filaments for electric lamps, which possess twice the efficiency of the carbon filament lamp.
Tellurium. Symbol Te. At. wt. 127.5. Valence II., IV. and VI. S. G. cryst. 6.2. M. P. cryst. 455°. B. P. 1400°.	Occ.—free and as tellurides. Prep.—by reducing tellurious acid (H_2TeO_3) by means of sulphur dioxide. Prop.—the crystalline variety is white, has metallic luster, and conducts heat and electricity. The precipitated variety is black and of lower density. The element is related to sulphur but is more metallic in character.	The compounds find few applications. Telluric acid (H_6TeO_6) has basic as well as acid characters, in keeping with the position of the element between metals and nonmetals.
Terbium. Symbol Tb. At. wt. 159.2. Valence III.	Occ.—in gadolinite, samarskite, and other rare minerals. Prep.—the metal has not been prepared.	The salts show no absorption spectrum.
Thallium. Symbol Tl. At. wt. 204.0. Valence I., and II. S. G. 11.8. M. P. 303. B. P. 1515°.	Occ.—in crookesite, and in small quantities in many samples of iron pyrites. Prep.—it is precipitated by zinc from a solution obtained by suitable treatment of the flue dust from sulphuric acid works. Prop.—a bluish-white, lead-like metal, rather soft, malleable, but of low tensile strength. It decomposes water rapidly at red heat, and dissolves in dilute acids.	It forms two sets of salts, the thallous (e.g., TlCl) and the thallic (e.g., $TlCl_3$). All the compounds show a characteristic green line in the spectrum.
Thorium. Symbol Th. At. wt. 232.4. Valence IV. S. G. 11.0. M. P. above 1700°.	Occ.—in monazite sand. Prep.—by reducing potassium thorium chloride with sodium, or by electrolysis of the chloride in a mixture of fused potassium and sodium chlorides.	The nitrate $[Th(NO_3)_4,6H_2O]$ is used in making W lsbach incandescent mantles, which consist of 99% of ThO_2. All the compounds are radio-active.
Thullium. Symbol Tm. At. wt. 168.5. Valence III. M. P. 1700°.	Occ.—in gadolinite and other yttrium minerals. Prop.—a metal with the color of nickel, that can be burnt in air. Hydrochloric acid attacks it but slowly.	The salts are of a pale bluish color which is destroyed very easily by minute quantities of erbium.
Tin. Symbol Sn. At. wt. 118.7. Valence II. and IV. S. G. white 7.3. gray 5.7. M. P. 231.8°. B. P. 2275°.	Occ.—as cassiterite (SnO_2). Prep.—after roasting, the ore is reduced by heating with carbon. Prop.—a silver-white, rather soft, very malleable and ductile metal, practically unchanged in air. When heated, it may be burned in air. Dilute nitric acid is the only dilute acid that attacks it rapidly. When kept long at temperatures below zero Centigrade, ordinary tin changes to a brittle, gray, powdery modification. This form is the stable one below 20°.	Large quantities of tin are used in the tinning of iron for tinplate. It is a constituent of the alloys Britannia metal, pewter, solder, bronze, etc. Tin forms two sets of salts, stannous (e.g., $SnCl_2$) and stannic (e.g., $SnCl_4$). "Pink salt" $[(NH_4)_2SnCl_6]$ is used in dye. "Mosaic gold" is SnS_2.
Titanium. Symbol Ti. At. wt. 48.1. Valence II., III. and IV. S. G. 4.5. M. P. below 1850°.	Occ.—as rutile (TiO_2) and in titanic iron ore ($FeTiO_3$). Prep.—by reducing the chloride ($TiCl_4$) by means of sodium. Prop.—a hard, brittle metal, resembling polished steel in appearance, that may be forged at a low red heat. It dissolves in dilute sulphuric acid, and decomposes steam at 800°. It unites easily with nitrogen.	The element is very widely disseminated, though in small quantity. It is contained in the ashes of all plants.
Tungsten. Symbol W. At. wt. 184.0. Valence II., IV., V. and VI. S. G. 19.3. M. P. 3177°. B. P. ca. 3700°.	Occ.—as wolfram ($FeWO_4$) and as scheelite ($CaWO_4$). Prep.—by reducing tungstic acid (H_2WO_4) by carbon at a high temperature. Prop.—a hard, brittle, gray metal, attacked by chlorine only at 250°, although it can be caused to burn in air. It is slowly acted upon by dilute acids and even by water.	The metal is used for the filaments of incandescent electric lamps, giving an efficiency of 1.3 watts per candle power. Tungsten steel has 5% W. Sodium tungstates are used as mordants in dyeing.
Uranium. Symbol U. At. wt. 238.2. Valence III., IV., V. and VIII. S. G. 18.7. M. P. ca. 1500°.	Occ.—as pitchblende, which contains U_3O_8. Prep.—by reducing the oxides with aluminum. Prop.—a white, lustrous metal, tarnishing in air and attacking water slowly in the cold. It combines directly with many of the other elements.	All the compounds of uranium are radioactive in proportion to their uranium content. Glass to which uranium compounds have been added shows a greenish-yellow fluorescence.
Vanadium. Symbol V. At. wt. 51.0. Valence II., III., IV. and V. S. G. 5.7. M. P. ca. 1715°.	Occ.—in a few rather rare minerals. Prep—by reduction of the dichloride (VCl_2) in hydrogen. Prop.—a silver-white, lustrous metal, harder than quartz. It does not tarnish nor attack water at ordinary temperatures, but can be burnt in oxygen.	Vanadium added to steel in even small quantity (0.2%) increases the tenacity and elastic limit without reducing the ductility.

TABLE OF ALL THE KNOWN CHEMICAL ELEMENTS—Continued

Name and Important Data	Occurrence, Preparation and Properties	Compounds and Chief Uses
Xenon. Symbol Xe. At. wt. 130.2. Valence 0. B. P. 109°. S. G. (liquid at B.P.) 3.82.	Occ.—in minute quantity in the air, less than one volume in 100 million. Prep.—by fractionation of liquid argon. Prop.—a transparent, colorless and odorless gas, very inert like its congener argon. It is the densest of the argon family.	It forms no compounds.
Ytterbium (Neoytterbium). Symbol Yb. At. wt. 173.5. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—the metal has not been isolated.	The compounds show a characteristic spark spectrum.
Yttrium. Symbol Y. At. wt. 88.9. Valence III. S. G. 3.8.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—by electrolysis of sodium yttrium chloride. Prop.—a gray, lustrous metal.	The chloride yields a characteristic, though complex, spectrum.
Zinc. Symbol Zn. At. wt. 65.37. Valence II. S. G. 6.9 to 7.2. M. P. 419.3°. B. P. 906°.	Occ.—as zinc blende (ZnS), calamine ($ZnCO_3$), zincite (ZnO), etc. Prep.—after roasting, the ore is reduced by coal, the metal distilling off. Prop.—a bluish-white, lustrous, brittle metal, that is malleable and ductile at 120°. It tarnishes in moist air, attacking water slowly in the cold and rapidly when heated in steam. It dissolves in dilute acids and in sodium hydroxide solution.	Sheet zinc is used for roofs and gutters. Iron is galvanized by dipping it in molten zinc, and so protected from rusting. Zinc is used for galvanic batteries and, alloyed with copper, to make brass. The salts are used in medicine; the chloride and sulphate antiseptic solutions.
Zirconium. Symbol Zr. At. wt. 90.6. Valence IV. S. G. 6.4.	Occ.—as zircon ($ZrSiO_4$). Prep.—by reducing the oxide (ZrO_2) with carbon in the electric furnace. Prop.—a hard, gray metal, remaining bright in air and only slowly oxidized at a white heat. It is dissolved by aqua regia and by caustic potash solution.	The oxide is contained in some incandescent gas mantles.

CHEMISTRY OF THINGS FAMILIAR

What is Starch?—How Manufactured?—Composition of Wheat Flour—Acids—Alkalies—Sulphuric, Nitric, and Muriatic Acids—Sulphuretted Hydrogen—Tanning of Hides to Form Leather—Vinegar—Alcohol—Yeast—Fruit, How Preserved—Decay in Wood—What is Ether?—Disinfecting Agents—How Smoking Preserves Meat—What is Albumen?—What is a Poison?—Arsenic—Certainty of its Detection—Lead Pipes, How Poison Water—Verdigris—Calomel—Preservation of Wood—Common Names of Chemicals

What is starch?

The name starch is given to a *mealy substance* which is deposited in *most vegetables* at the time of ripening, from the juices with which the cells of the plants are filled.

What common vegetable especially abounds in starch?

The *potato,* which consists entirely of cells filled with starch and water.

A cell is a little membranous bladder filled with a solid or fluid substance.

Why does a laundress find it necessary to boil starch before using it for stiffening linen, etc.?

The starch, consisting of little granules, is *insoluble in cold water;* but when acted upon by hot water, the granules burst and allow their contents, which are soluble, to become mingled with the water.

Starch is manufactured as follows:—

Potatoes, for example, from which most of the starch of commerce is manufactured, after being pared, are grated to a pulp. This pulp is put upon a sieve and stirred about, while at the same time a little stream of water is made to flow upon it. A milky liquid runs through the sieve, but the fibrous portion of the potato, the vegetable tissue, remains behind. This liquid, after a short interval, deposits a white powder, which is the starch. By the simple process of tearing up the vegetable tissue, and removing the inclosed starch by washing, this substance may be procured from a great variety of plants.

Why do potatoes, beans, rice, and most of the common vegetables, swell up when boiled with water?

Because the *starch absorbs water* at the boiling temperature, which causes the *cells to swell,* thereby giving to the vegetable a rounded appearance.

What is the composition of wheat flour?

Starch is one of the *principal constituents* of wheat flour, as well as of all other kinds of meal. The other principal constituent is a gray, tough, viscous substance, called *gluten.*

To what does paste, made of wheat or rye flour, owe its adhesiveness?

In some measure to the *starch,* but principally to the *gluten* contained in it.

Can starch be converted into gum and sugar?

It *can; fruits and plants effect this change naturally:* we can also produce the change artificially by chemical processes.

Why are potatoes frozen and thawed sweet?

Because by the *freezing action* the starch of the potato is in part *converted into sugar.*

Why are apples, pears, grapes, etc., in their unripe state sour, and in their ripe condition sweet?

In the unripe fruits mentioned *starch is present;* in the ripe fruits it is *absent;* in the process of ripening the starch is *converted into sugar,* and the fruit becomes sweet.

What are acids?

Acids are substances which excite the *taste of sourness* when applied to the tongue; they change the *blue juices* of vegetables to *red,* and combine with alkalies to form neutral compounds.

What is an alkali?

An *alkali* is a body that possesses properties the *converse of those of an acid.* It has a *highly bitter, acrid taste,* changes the *blue juices* of vegetables to *green,* or the juices of vegetables which have been changed red by an acid, back again to blue. Potash and soda are the representatives of the alkalies.

When sulphur is burned in the air what is the product formed?

Sulphurous acid.

What causes the suffocating odor of a lighted brimstone match?

The *sulphurous acid* generated by the combustion of the sulphur.

What is sulphuric acid or oil of vitriol?

It is a compound of *sulphur and oxygen,* containing one-third more oxygen than sulphurous acid.

What is sulphuretted hydrogen?

A *gas* formed by the union of *sulphur and hydrogen.* It possesses an offensive odor, and is very poisonous.

How is sulphuretted hydrogen formed in nature?

Principally from the *decomposition of animal substances,* as blood, flesh, hair, etc.

Why does the yolk of an egg tarnish a silver spoon?

Because it contains a *little sulphur,* which, at the temperature of an egg just boiled, will decompose the water or moisture upon the spoon, and produce *sulphuretted hydrogen gas,* which will tarnish silver.

Both the white and the yolk contain sulphur, but the latter the most abundantly.

What is it that makes an open or foul sewer so destructive of health to any district in which it may be situated?

The evolution of *sulphuretted hydrogen.* When inhaled, it acts directly upon the blood, thickening it, and turning it black.

Why do surfaces painted with lead paints, in the vicinity of sewers, soon turn black, or become discolored?

Through the action of *sulphuretted hydrogen.*

What is nitric acid?

Nitric acid, or aqua-fortis, is a compound of five parts of oxygen and one of nitrogen.

It is *liquid;* when pure, *colorless,* and highly *corrosive;* it attacks almost all dead, unorganized substances, and destroys living tissues.

What is muriatic, or, more properly, hydrochloric acid?

A compound of *hydrogen and chlorine* usually prepared from salt. It is an acid much used in the arts.

What is "lunar caustic"?

A compound of *nitric acid* and *oxide of silver.*

Why, when lunar caustic is applied to the flesh, does it burn and destroy it?

Through the agency of the *nitric acid* contained in it.

Do plants produce acids?

Acids are formed in the *vegetable kingdom* in *great abundance;* they especially exist in unripe fruits, imparting to them a sour taste.

Acids formed from mineral substances are called "mineral acids"; acids formed by or from vegetable substances are called "organic acids."

Why does tanning hides convert them into leather?

Hides are steeped in water, with ground bark of the oak, hemlock, or other trees; these barks contain large quantities of *tannic acid,* which combine with the skin of animals, and form a combination which is insoluble in water and not subject to putrefaction—viz., leather.

What is ordinary vinegar?

An *acid,* called *acetic acid,* and water.

If wine or beer be imperfectly corked, why does it rapidly turn sour?

Because air gets into the liquor, and the oxygen of the air combining with the alcohol of the liquor produces acetic acid, or *vinegar.*

What is alcohol?

Alcohol is the *spirit* existing in wine, beer, cider, etc., *obtained in the process of fermentation.*

What is a ferment?

A ferment is a substance containing *nitrogen* in a state of *decomposition,* which is able to excite fermentation in solutions of sugar; old cheese, putrefying flesh, blood, etc., all of them are ferments.

What is yeast?

We apply the term yeast to a particular species of ferment; the *foam of beer* (or of some similar liquor), produced by *fermentation.*

Can you explain why it is that a body in a state of fermentation or putrefaction should cause unlimited quantities of similar matter to pass into the same state?

We only *know the fact:* the reason we are *ignorant of.* The most minute portion of milk, paste, juice of grapes, flesh, or blood, in a state of fermentation or putrefaction, causes fresh milk, paste, grape juice, flesh, or blood, to pass into the same condition, when in contact with them.

In storing or packing fruit for future use why is it necessary to carefully remove every decayed specimen?

Because the decayed portions of one specimen will quickly *communicate decay to the fresh fruit in contact* with it, and soon the whole mass of fruit will become putrescent.

If in a vessel, or any other structure, one timber becomes decayed what course ought to be adopted?

It should be removed *immediately,* or the decomposition once commenced will in time affect the whole structure.

It sometimes happens that physicians, in dissection, are seriously poisoned by the slightest cut of a knife which has been used upon the dead body. The knife introduces to the healthy blood, through the wound, a *minute portion of matter in the state of decomposition or putrefaction.* This acts as a *ferment,* and causes the healthy matter in contact with it to pass into the same decomposed state. The action once commenced rapidly extends, until the whole body becomes affected, and death ensues. It is almost impossible to heal wounds of this character.

Why is it especially dangerous to eat fruit or meats partially decayed?

Because the *decayed portions* of the substance eaten are liable to induce the *same condition* in the healthy organs of the stomach with which they may come in contact.

Why do fruit preserves frequently turn sour?

Because, owing to the action of some fermenting substance present either in the fruits themselves or in the air, the sugar used in preserving is *converted into alcohol,* and the alcohol into vinegar.

Why does the housewife scald her preserved fruits to prevent their turning sour?

Because fermenting substances and fermenting action are *destroyed* by a boiling temperature.

Why do we keep preserves, beer, cider, or other substances liable to turn sour, in a cool place?

Because a depression of temperature *arrests fermentation,* though it does not prevent its renewal when the temperature in increased.

What is ether?

Ether is a product obtained by *distilling strong alcohol* and *sulphuric acid.* The product is called sulphuric ether, but it does not contain sulphuric acid, nor has it any sulphur in its composition.

What are the properties of ether?

It is an *exceedingly volatile, inflammable* body, producing insensibility when inhaled, and readily dissolving all fatty and oily bodies.

Why will ether remove spots of oil, paint, or grease from garments?

Because it is a *solvent* for all greasy, oily matters.

What are the best agents for depriving putrid and decaying animal and vegetable substances of their offensive odors?

Chloride of lime is the most effectual agent; and *chloride of zinc* and *sulphate of iron* (green vitriol) are also exceedingly efficient. On a large scale, as in the sanatory cleansing of towns, pulverized charcoal, burnt clay, and quicklime are to be recommended.

What effect does the use of perfumes or the burning of pastiles have upon offensive odors?

They merely *disguise* the odor, but do *not remove or destroy it.*

By adopting what precautions may a person safely enter sick rooms, or visit, without risk, the most dangerous receptacles of filth?

By moistening a linen cloth with vinegar, and sprinkling over it finely-powdered chloride of lime.

Air breathed through this, applied to the mouth and nostrils, will enter the lungs charged with a minute quantity of chlorine, which will effectually destroy any noxious vapors or miasms that escape from diseased bodies, or from decaying animal and vegetable substances.

What three conditions are requisite to produce putrefaction in animal and vegetable substances?

It is necessary that they should be exposed to the combined influence of *air*, *heat*, and *moisture.*

Why is a substance preserved from decay by drying, or by the exclusion of air from it?

Because by so doing we *remove* the *moisture* and *air* essential to the process of decay.

Why does the smoking of fish or flesh contribute to their preservation?

Because the volatile matters of the smoke, such as creosote, pyroligneous acid, and the like, effect a species of *chemical combination* with the fiber of the meat, and with the substances contained in the natural juices of the flesh, which combinations are *less liable* to decay than the substances themselves.

What is albumen?

Albumen is an *animal substance* as well as *vegetable.* It exists most abundantly, and in its purest natural state, in the *white of an egg,* from whence it derives its name (*album ovi*), which is the Latin for the white of an egg.

The serum or fluid portion of the blood (which, after exposure to the air, is separated from the more solid part), the vitreous and crystalline humors of the eye, the brain, the spinal marrow, and nerves, all contain albumen.

What is the yolk of an egg?

This also consists of *albumen*, but contains in addition a *yellow oil*, which imparts to it its color.

Why is meat tough which has been boiled too long?

Because the *albumen* becomes hard, like the white of a hard-boiled egg.

The best way of boiling meat to make it tender is this: Put your joint in very brisk boiling water; after a few minutes add a little cold water. The boiling water will *fix* the albumen, which will prevent the water from soaking into the meat, keep all its juices in, and prevent the muscular fiber from contracting. The addition of cold water will secure the cooking of the *inside* of the meat, as well as of the surface.

Why is meat always tough if it be put into the boiler before the water boils?

Because the water is not hot enough to *coagulate* the albumen between the muscular fibers of the meat, which therefore runs into the water, and rises to the surface as scum.

Why is the flesh of old animals tough?

Because it contains *very little* albumen, and much muscular fiber.

What is a poison?

A poison is any agent capable of producing a dangerous effect upon anything endowed with life.

In cases of poisoning by substances taken into the stomach, what course should be pursued, in the absence of medical attendance?

The first step is to evacuate the stomach by means of powerful emetics, and when vomiting has taken place, warm water and the white of eggs may almost always be given with advantage.

Can poisons administered for criminal purposes be almost certainly detected?

They can; chemical science within the last few years has made such advances that the most minute quantities of all the best known poisons can be detected with certainty long after death.

There is no poison *so liable* and *certain* to be found as *arsenic*, and in almost every case of poisoning with mineral poisons, science is enabled to detect the substance, even when life has been extinct for years, and the body nearly decomposed.

What is arsenic?

Metallic arsenic is an *exceedingly brittle metal,* of a *steel-gray color.* It vaporizes, when heated, with a strong odor of garlic, a property not possessed by any other metal.

The substance used as poison, and sometimes known as ratsbane, is arsenious acid, a compound of arsenic and oxygen. Arsenious acid has the form and appearance of a fine white powder.

What is the best remedy in cases of poisoning with arsenic?

The *hydrated peroxide of iron* (iron rust) is considered the best remedy.

The following is the best method for preparing this substance: Take common copperas (sulphate of iron) four ounces; dissolve in warm water in a glass, or porcelain dish, and add a small quantity of sulphuric acid, and afterwards ammonia solution, so long as a dense red precipitate is formed. This precipitate carefully strained off, and thoroughly washed in a filter with water, is hydrated peroxide of iron. So long as kept moist, it may be preserved for a great length of time.

Is lead a poison?

Lead and nearly all its compounds are *dangerous* and *secret poisons;* when received into the system, it frequently remains dormant for years, and then suddenly manifests itself in various forms of disease.

What is the disease called "painter's colic"?

A disease to which painters and others *working in lead are liable,* in consequence of receiving into their system, imperceptibly, portions of lead.

Is it dangerous to sleep in, or breathe the air of, a room newly painted with paints containing lead?

It is *highly dangerous,* since the air is filled with a vapor of the lead compound used as paint.

Why are some waters, when conveyed through lead pipe, poisonous?

Waters which are *very pure* and contain *much oxygen* dissolved in them; waters which contain *nitric acid* compounds, such as those flowing from the vicinity of barn-yards, manure heaps, and those which contain *common salt* or *organic matter*, as water flowing from swamps and fields; waters containing soluble *carbonates* —all dissolve lead from the pipes through which they may be made to pass. Constant use of such waters, in the process of time, will introduce sufficient lead into the system to produce disease, which is often attributed to other causes.

What is verdigris?

Verdigris is a compound of copper, oxygen, and acetic acid. This, and all the compounds of copper, are *very poisonous.* The most efficacious antidotes for poisoning with copper are white of eggs and milk.

What is calomel?

It is a compound of *two parts of mercury* united to one of *chlorine*, forming the sub-chloride of mercury. The preparation, commonly known in medicine as "blue pill," is a preparation of calomel.

What is corrosive sublimate?

A compound of *mercury and chlorine* united in equal proportions, forming the perchloride of mercury.

Are both these compounds, calomel and corrosive sublimate, poisons?

They *are;* corrosive sublimate, especially, is a most *deadly poison.* In case of poisoning by it, the most effectual antidote is white of eggs.

What is the process of preserving wood from decay, commonly termed "kyanizing"?

It consists in *saturating* the fibers of the wood with a *solution of corrosive sublimate.*

Poisonous substances, and corrosive sublimate especially, have the property of protecting animal and vegetable substances from decay. The skins of stuffed birds and animals, and the plants of a herbarium, may be protected from insects and decay, by washing them with a solution of corrosive sublimate. It should not, however, be forgotten that these substances by such treatment become themselves poisonous.

Give a list of the chief antidotes for poisons.

(See Book of the Human Body.)

What are the common names of familiar chemical substances?

Common Names of Chemicals

Common Names	*Chemical Names and Formulæ*
Alum	Sulphate of Aluminum and Potassium
Aqua Fortis	Nitric Acid, HNO_3
Aqua Regia	Nitro-Hydrochloric Acid
Calomel	Mercurous Chloride, Hg_2Cl_2
Carbolic Acid	Phenol, C_6H_5OH
Caustic Potash	Potassium Hydrate, KOH
Caustic Soda	Sodium Hydrate, NaOH
Chalk	Calcium Carbonate, $CaCO_3$
Copperas	Sulphate of Iron
Corrosive Sublimate	Mercuric Chloride, $HgCl_2$
Cream of Tartar	Potassium Bitartrate
Epsom Salts	Magnesium Sulphate
Ether	Diethyl Oxide, $(C_2H_5)_2O$
Fire Damp	Light Carburetted Hydrogen
Galena	Lead Sulphide, PbS
Glauber's Salt	Sodium Sulphate
Glucose of Grape Sugar	Dextrose, $C_6H_{12}O_6$
Goulard Water	Basic Acetate of Lead
Iron Pyrites	Iron Di-Sulphide, FeS_2
Jewelers' Putty	Oxide of Tin
Laughing Gas	Nitrous Oxide, N_2O
Lime	Calcium Oxide, CaO
Lunar Caustic	Silver Nitrate, $AgNO_3$
Mosaic Gold	Bi-Sulphide of Tin
Muriatic Acid	Hydrochloric Acid, HCl
Olefiant Gas	Ethylene, C_2H_4
Plaster of Paris	Calcium Sulphate
Quartz	Silicon Dioxide, SiO_2
Realgar	Arsenic Di-Sulphide, As_2S_2
Red Lead	Oxide of Lead, Pb_3O_4
Rochelle Salt	Sodium Potassium Tartrate
Salammoniac	Ammonium Chloride
Salt, Common	Sodium Chloride, NaCl
Salt of Tartar	Potassium Carbonate
Saltpeter	Potassium Nitrate, KNO_3
Salts of Lemon	Oxalic Acid
Slaked Lime	Calcium Hydrate
Soda	Sodium Carbonate
Spelter	Zinc
Spirits of Hartshorn	Amm. Hydroxide, NH_4OH
Spirits of Salt	Hydrochloric Acid, HCl
Sugar of Lead	Lead Acetate
Tartar Emetic	Potass. Antimony Tartrate
Verdigris	Basic Copper Acetate
Vermilion	Sulphide of Mercury
Vinegar	Dilute Acetic Acid
Vitriol, Blue	Copper Sulphate
Vitriol, Green	Ferrous Sulphate
Vitriol, Oil of	Sulphuric Acid, H_2SO_4
Vitriol, White	Zinc Sulphate
Volatile Alkali	Ammonia

What is meant by radio-activity and radio-active substances?

Radio-activity is the phenomenon associated with substances which spontaneously emit rays of unique penetrating power through the escape of electrons and their striking against other substances. Chief of the radio-active substances are radium, polonium, actinium, thorium, etc.

What is the history of these substances?

Henri Becquerel in 1896 first observed this in the case of potassium uranyl sulphate, the rays from which he found affected a photographic plate through black paper, thin plates of metal, etc.; the property was further traced in other uranium salts and in uranium itself. These rays are known as *Becquerel rays,* and have the further power to render air a conductor of electricity, and thus to discharge any electrified substance placed near them.

A charged electroscope forms a test of radio-activity, and the rate at which the leaves fall measures the degree. Different uranium salts have different degrees of radio-activity; some varieties of pitchblende, as also chalcolite, show the property in excess of uranium contained.

Madame Curie, by using the activity test for every precipitate obtained from pitchblende, succeeded in discovering the elements *polonium* and *radium* in 1898. The next year Debierne discovered *actinium,* another radio-active element in the same substance. Meanwhile Schmidt and Madame Curie independently found that the same properties were associated with *thorium,* its compounds and the minerals containing it. In 1903 Ramsay and Soddy discovered that radium continuously produces helium, the lightest of the inactive gases discovered by Ramsay in 1896.

Twenty-eight elements are now classed in three divisions with the three parents, uranium, thorium, and actinium. Potassium and rubidium have been shown to be radio-active, but otherwise the alkaline metals do not enter the classes.

Describe radium and its special properties.

What It Is Like.—To the eye a tiny sample of radium—or, to speak more correctly, of one of the radium salts, for radium in a pure state (*i.e.* the metal) has not been obtained as yet—presents no very striking appearance. All one sees is a few tiny crystals, or perhaps a few specks of whitish-looking powder, glowing in the dark with a faint phosphorescent light similar to that sometimes emitted by a piece of decaying fish.

The Radiations are of three kinds, comparable with those of the vacuum tube: *Alpha*-rays are heavy particles, positively charged, similar to the canal rays; *Beta*-electrons, negative like cathode rays; *Gamma*-rays resemble Röntgen rays. They penetrate matter to different degrees, behave differently under the action of a magnetic field, but under ordinary circumstances travel in straight lines.

But rays from different elements vary in penetration, and also with the absorbing substance, varying roughly with the density.

The *Alpha*-rays have a velocity of from $1.56 \times 10_9$ centimeters per second (radium) to $2.25 \times 10_9$ centimeters per second (thorium); they are particles of helium carrying a double charge of electricity. *Beta*-rays have a greater range of velocity and approach that of light. Both

Alpha- and *Beta*-rays are absorbed by a thickness of one centimeter of lead, but *Gamma*-rays pass through an inch of lead; they carry no charge of electricity, yet ionize the air and discharge the electrometer.

All the rays on impinging on solid particles give rise to *secondary rays*, sometimes called *Delta*-rays, electrons moving with comparatively low velocity. The *Alpha*-rays possess ninety-five per cent of the energy evolved and produce brilliant fluorescence in zinc sulphide, diamond, etc., the other rays producing this best in willemite and the platino-cyanides; all become absorbed and transmuted into heat.

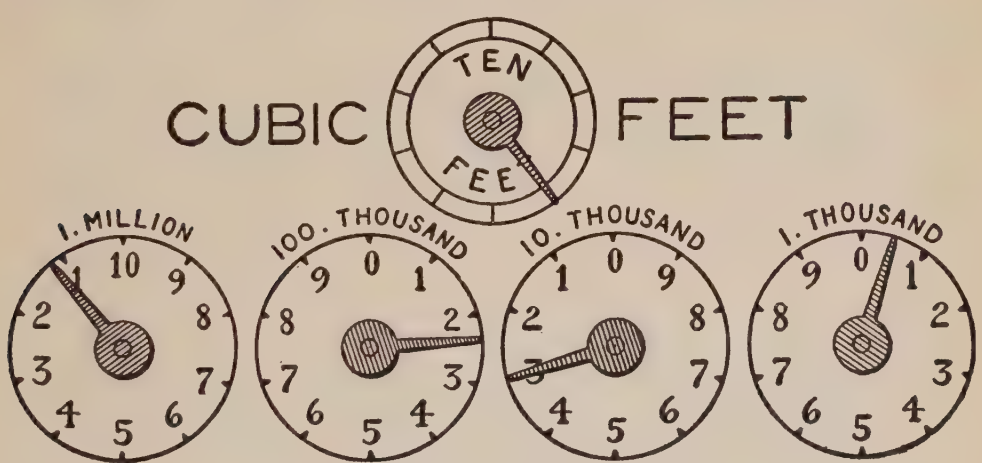
Radium every hour generates sufficient heat to raise its own weight of water from freezing to boiling point.

The Spinthariscope.—This is a simple piece of apparatus invented by Sir William Crookes, by means of which some of the effects of the *Alpha*-ray particles can be observed in a very striking manner. In consists of a little screen covered with powdered zinc sulphide. A small fragment of radium is placed directly in front of the middle of the screen and in close proximity to it. On observing this screen in the dark through a suitable lens, scintillating little points of light are seen to be continually flashing into view and dying away. Each tiny spark is thought to be produced by the impact of a single *Alpha*-ray particle. That these particles or emanations must be matter in a state of extreme attenuation is proved by an experiment of Professor Curie's in which a box constructed of platinum was pierced with two holes so minute as to be capable of retaining a vacuum, and yet these radium emanations passed through quite freely.

What are the medical uses of radium?

Ulcerous growths, birth-marks, and scars are beneficially treated, but so far the selective action of radium on tissue has not been determined, nor its bactericidal effect. Its results in the treatment of cancer have not yet reached a definite stage, though it has been widely heralded as a specific for that dreadful malady.

The application of the rays is by various methods: inhalation of the emanation; external application or injection of the emanation condensed on glycerine, vaseline, oil, water, etc.; or the taking of quinine, arsenic, bismuth, etc., on which the emanation has been condensed. Injections of very dilute solutions of radium salts, or insoluble salts suspended in water, are made. But external applications of the rays are considered most important; copper plates or linen are coated with varnish containing the salts, or glass tubes contain them, and the radiations are directly applied, the surrounding parts being protected with lead foil.



GAS METER INDICATOR DIALS.

HOW TO READ A GAS METER

The dial marked "1 thousand" in the accompanying illustration is divided into hundreds; the dial marked "10 thousand" is divided into thousands; that marked "100 thousand" into ten-thousands, and that marked "1 million" into hundred-thousands. When 1,000 cubic feet of gas have been consumed, the pointer on the dial marked "1 thousand" will have made a complete rotation and the fact will be indicated by the pointer of the next dial at the left, which will point to the figure 1. When 10,000 cubic feet of gas have been consumed, the pointer on the "10 thousand" dial will point to 1, and so on. In reading a gas meter, put down the hundreds first, then the thousands, and so on, always counting the figure just under, or which has just been passed by, the pointer. In the illustration about half a hundred is indicated on the "1 thousand" dial, three thousands is indicated on the next dial, two ten-thousands on the next dial, and one one-hundred-thousand on the "1 million" dial. The reading will be 123,050. The dial marked "ten feet" is called the units dial. It is used for testing the meter to discover whether it is in working order or not. Each mark represents a cubic foot and the complete circle 10 cubic feet. If the pointer moves when no gas is burning, it indicates a leak. If it does not move when the gas is burning, or if its motion is unsteady, it indicates a derangement in the mechanism and shows that the meter requires attention.

SOME GREAT MECHANICAL INVENTIONS

STEAM ENGINES

What are steam engines?

Steam engines are machines in which the elastic force of steam is used as a motive power. In the ordinary engines the alternate expansion and condensation of steam imparts to a piston an alternating rectilinear motion, which is changed into a circular motion by means of various mechanical arrangements.

The engine is unquestionably the grandest and most influential for good of all the great inventions in the realm of physics. No other contrivance of man can be compared with this gigantic, yet tractable motor, in relieving both man and beast of ceaseless toil and irksome drudgery; in preventing suffering and starvation, and promoting intercourse, progress and civilization among the nations of the earth.

Give a description of the steam engine.

Every steam engine consists essentially of two distinct parts: the apparatus in which the steam is produced, and the engine proper. We shall first describe the former.

STEAM BOILER.—The boiler is the apparatus in which steam is generated. Usually a cylindrical boiler is used for fixed engines; those of locomotives and of steam vessels are very different.

The steam is produced from water at a pressure considerably above that of the atmosphere, and is delivered to the engine with as little loss of pressure and heat as possible. The higher the pressure of the steam, the greater will be the amount of heat available, in a given weight of steam, for conversion into mechanical energy. Only a fraction of the total heat energy given to the steam in the boiler is converted into the mechanical work in the engine. By far the greater portion still remains in the steam after it has passed through the engine. The proportion of heat utilized depends on the thermal efficiency of the engine, amounting from twelve to fifteen per cent in good condensing engines; in the very best engines of large size it may be as high as twenty per cent.

The terms axis, axle, arbor, and shaft, in mechanics, are generally understood to mean the bar, or rod, which passes through the center of a wheel. A gudgeon is the pin, or support, on which a horizontal shaft turns; the pins upon which an upright shaft turns are called pivots.

The engine proper consists of a hollow *cylinder* closed at both ends; inside it is the *piston*, a sliding partition which fits the bore of the cylinder sufficiently close to prevent the steam leaking past it, but having sufficient freedom to allow it to move from end to end of the cylinder with as little friction as possible.

In modern engines the pressure of the atmosphere is not employed to drive the piston down. The steam is admitted into the cylinder above the piston at the same time that it is condensed or withdrawn from below, and thus exerts its expansive force in the returning as well as in the ascending stroke. This results in a great increase of power.

The practical construction of the piston and cylinder, and the arrangement of connecting pipes by which steam is admitted alternately above and below the piston, is fully shown in Figure A. This gives a sectional view of the cylinder, of the piston, and of the distribution of steam. The entire engine is of iron. To the piston, T, is fixed a rod, A, which slides with gentle friction in a tubulure, U, placed at the center of the plate which closes the cylinder. As it is very important that no steam shall escape between the piston-rod and this tubulure, the latter is formed of two pieces, one attached to the plate, while the other, which fits in the

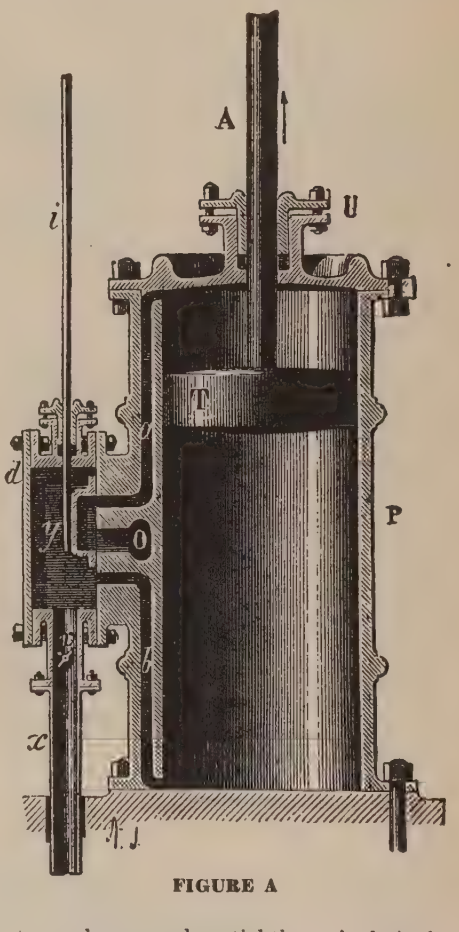

FIGURE A

first, can be pressed as tightly as is desired, so as to compress the material soaked with fat which is between the two tubulures. This arrangement is called a *stuffing-box;* it prevents the escape of steam without interfering with the motion of the piston.

VALVE-CHEST.—This is the arrangement by which steam passes alternately above and below the piston.

Figure A presents a vertical section of this valve-chest and shows its relation to the cylinder. The steam enters the valve-chest from the boiler by the brass tube *x*. From the valve-chest two conduits, *a* and *b*, are connected with the cylinder, one above and the other below. If they were both open at once, the steam, acting equally on the two faces of the piston, would keep it at rest. But one of these is always closed by a *slide-valve*, *y*, fixed to a rod, *i*. This moves alternately up and down, by means of an eccentric, *e*, placed on the horizontal shaft. The

slide-valve closes the conduit *a*, and allowing the steam to enter at *b*, below the piston, the latter rises. But when it reaches the top of the stroke the rod *i* sinks, and with it the slide-valve, which then closes the conduit *b*, and allows the steam to enter at *a*. The piston then sinks, and so forth at each displacement of the slide-valve.

It now remains to explain what happens when the steam presses below the piston. It must not remain above, otherwise the piston could not move. But while the steam enters below by the conduit *b*, the top of the cylinder, by means of the conduit *a*, is connected with a cavity, O, from which passes the tube L. Through this tube the steam which has already acted upon the piston passes into the atmosphere, or else is condensed in a vessel filled with cold water, which is called the *condenser*. If, on the other hand, the piston sinks, the vapor below the piston passes, by the conduit *b*, to the cavity O, and to the tube L.

TRANSMISSION OF MOTION.—The alternating rectilinear motion thus generated within the cylinder is transmitted, by means of a rod attached to the piston, to a strong beam *ff*, movable upon a central axis, a system of jointed rods *ee*, called the *parallel motion*, being interposed for the purpose of neutralizing the disturbing action which the circular path of the beam would otherwise exert upon the piston. The reciprocating motion of the beam is now, through the intervention of the connecting-rod *g* and crank *h*, converted into a circular or rotatory motion, which is rendered continuous and uniform by the fly-wheel *i*, to the axis of which the machinery to be impelled is connected.

The air-pump, *p*, for withdrawing the vapor and water from the condenser, the feed-pump, *s*, for supplying the boilers, and cold-water pump, *t*, for supplying the condenser cistern, are all worked by rods from the beam; and the governor, *u*, for maintaining uniformity of motion, is driven by a band from the crankshaft. The above description refers more immediately to that class of steam engines called *low-pressure* engines.

TYPES OF ENGINES.—The various forms of the steam engine have received a varied form of classification. There are the general divisions into *condensing* and *non-condensing* engines, *compound* and *non-compound*, and *single*, *double*, or *direct acting*. Again there is the classification connected with the position of the cylinder, as in the *horizontal*, *vertical*, and *inclined* cylinder engines. Another classification divides steam engines into the uses to which they are applied, such as stationary engines, portable engines, marine, locomotive, electric generating, pumping, mill driving, winding, etc.

STEAM TURBINE.—The steam turbine, though the most modern form of the steam engine in practice, is the most ancient in actual history, the germ of the invention dating from Hero of Alexandria, in the second century B. C.

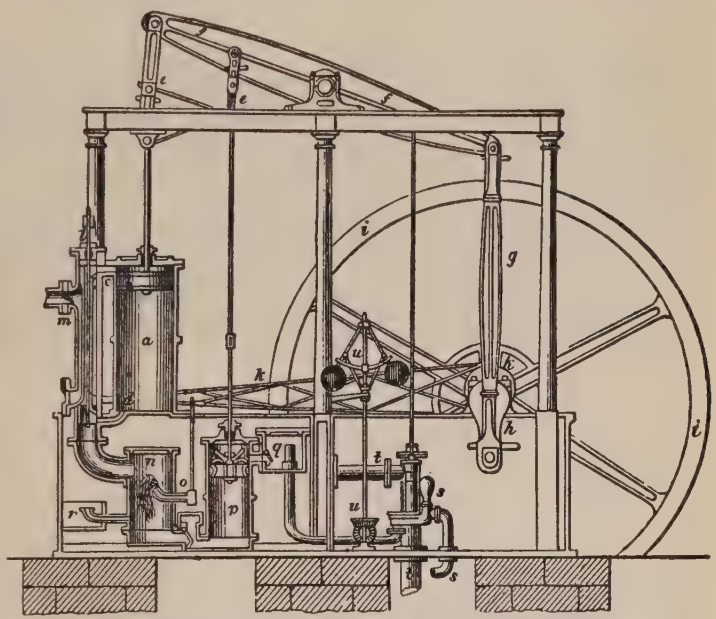

FIG. B—BEAM CONDENSING STEAM ENGINE

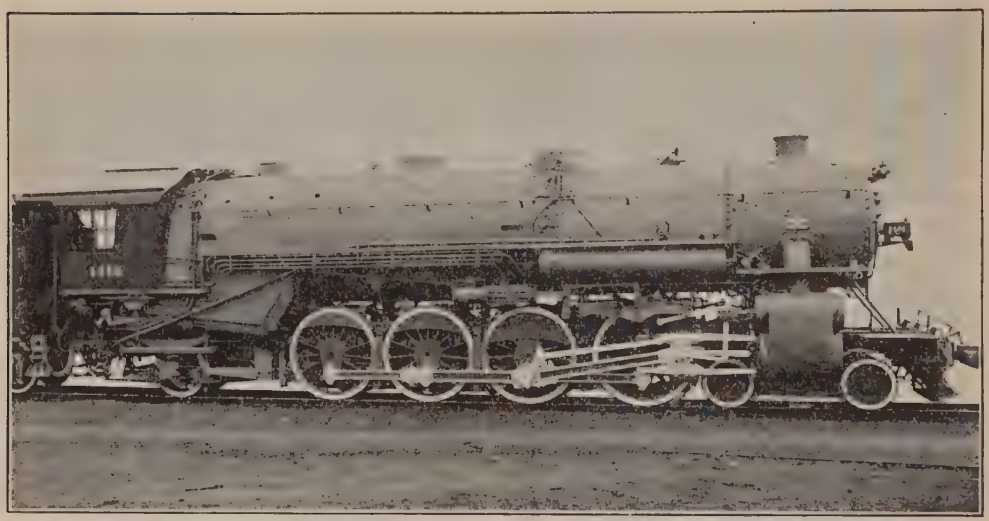
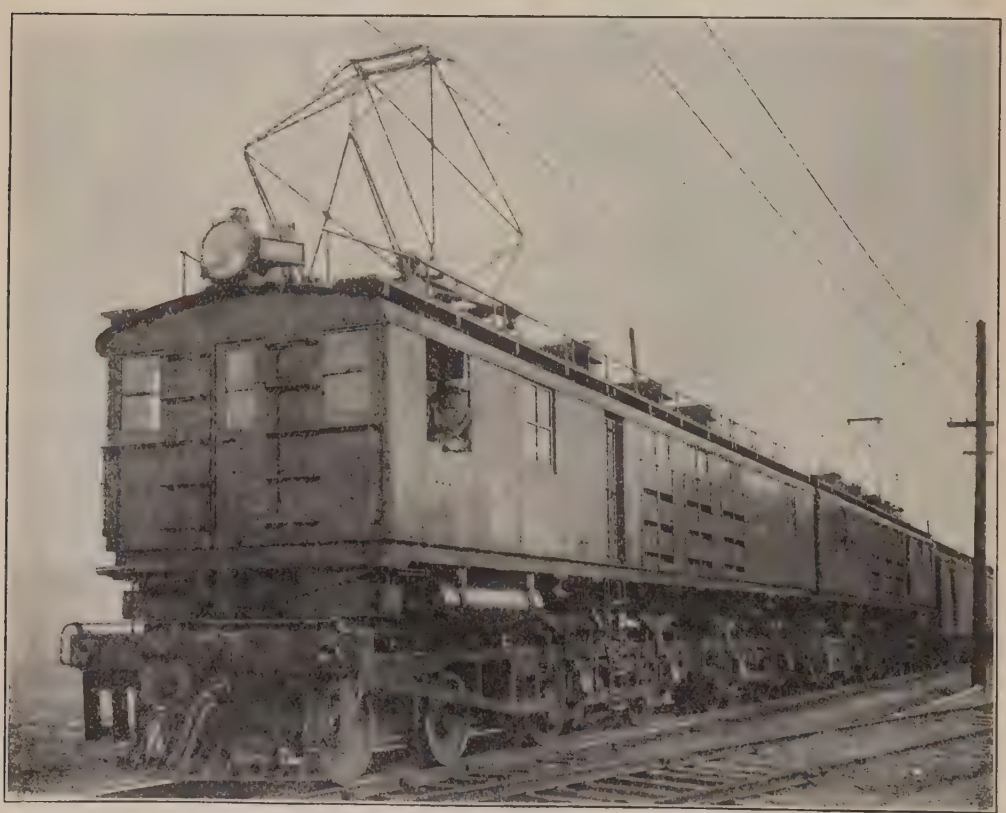
a, The steam-cylinder; *b*, the piston; *c*, the upper steam-port or passage; *d*, the lower steam-port; *ee*, the parallel motion; *ff*, the beam; *g*, the connecting-rod; *h*, the crank; *ii*, the fly-wheel; *kk*, the eccentric and its rod for working the steam-valve; *l*, the steam-valve and valve-casing; *m*, the throttle-valve; *n*, the condenser; *o*, the injection-cock; *p*, the air-pump; *q*, the hot-well; *r*, the shifting-valve for creating a vacuum in the condenser previous to starting the engine; *s*, the feed-pump for supplying the boilers; *t*, the cold-water pump for supplying condenser cistern; *u*, the governor.

One kind of steam turbine is really worked on the same principle as a windmill, only steam is used instead of the wind. Instead, however, of the sails making one revolution in seven or eight seconds, it sometimes makes three thousand revolutions a minute, or fifty revolutions a second. In another kind the blades of the turbine are something like the pockets on a water-wheel, and the steam shoves the wheel round by its great velocity.

Turbine engines are now fitted to vessels of large dimensions, up to ocean liners and battleships, with extremely satisfactory results. Turbine engines have also been applied in various other ways, *e.g.*, to the driving of fans and blowers.

The principle of internal combustion, as used in gas and oil engines, has also been applied to the turbine with marked success, and has done much to solve the all-important problem of efficiency. It is extremely improbable that the long-range activities of the submarine would be nearly so effective were it not for the application of the same principle to their engines.





MOST POWERFUL TYPES OF LOCOMOTIVES UP TO 1928

Above, steam locomotive manufactured by the American Locomotive Company; below, electric locomotive manufactured by the General Electric Company for the Chicago, Milwaukee and St. Paul R. R.

LOCOMOTIVES

Locomotive engines, or simply *locomotives*, are steam engines which, mounted on a carriage, propel themselves by transmitting their motion to wheels.

The parallel motion, the beam, and the fly wheel of the ordinary stationary engine form no part of a locomotive. The principal parts are the *framework*, the *fire box*, the *casing* of the boiler, the *smoke box*, the *steam cylinders*, with their valves, the *driving wheels*, and the *feed pump*.

The framework rests on the axles of the wheels. The illustration on another page shows clearly the arrangement and parts of a typical locomotive. It will be observed that in the lower part of the *steam dome* is the *fire box*, from whence the flame and the products of combustion pass into the smoke box, and then into the chimney after having previously traversed the numerous brass *fire tubes* which pass through the boiler. The *boiler*, which connects the fire box with the smoke box, is made of iron, and is cylindrical.

The steam passes from the boiler into two *cylinders*, placed on either side of the smoke box. There, by means of a steam chest similar to that already described, it acts alternately on the two faces of the piston, the motion of which is transmitted to the axle of the large driving wheels. After having acted on the pistons, the steam is forced through the blast pipe into the chimney, thus increasing the draft.

The motion of the pistons is transmitted to the large driving wheels by two connecting rods, which, by means of cranks, connect the piston rods with the axles of the wheels. The alternating motion of the slide valve is effected by means of eccentrics placed on the axles of the large wheels.

Wheels of the Locomotive.—The wheels range ordinarily from forty-five to eighty-five inches in diameter for drivers, thirty to forty-two inches for truck wheels. They are made of castiron or steel body and steel rim shrunk on. Spoked wheels are usual for drivers, solid wheels for trucks. The tread is four to five inches wide, the flange (one to one and one-quarter inch high) increasing this to five and one-half to seven inches. A counterbalance weight is cast between the spokes opposite the crank-pin seat. The axles, forged steel, are six to eight inches in diameter (for drivers); the wheels are forced on their ends by a powerful press. Cranked axles (for inside cylinders) are forged to shape, rarely built up.

Control.—The locomotive is controlled by the throttle-valve and the reverse lever. Both are located in the cab, which is built at the rear around the fire box, and serves also as firing platform.

Auxiliaries.—The necessary auxiliaries of the locomotive are those required for its operation as a power generator, and those necessary to its service as a railroad vehicle or as a tractor. The *tender* is the most important in the first group. It is a separate vehicle attached behind the locomotive, carrying a water tank of three to eight or nine thousand gallons capacity, and a coal bin of two to ten tons capacity. Eight-wheel (two-truck) tenders are usual. The coal space is at the front of the tender, and the water tank occupies the rear half and extends forward along the sides of the coal bin. The coal thus is reached directly from the rear of the engine cab.

Water is supplied to the engine by pipes leading from the tank to injectors on the engine. Feed pumps are rarely used for pumping the water into the boiler, injectors in duplicate being depended on. The safety valve, mounted on the top of the boiler, is of the spring poppet type. A steam whistle is placed alongside, for use as warning and train-movement signal; a bell operated from the cab by a cord is also mounted on the boiler.

The air-brake equipment of the locomotive comprises the brake mechanism for the engine itself, and an air pump with its governor, a main reservoir, and the engineer's valve, for supplying and manipulating the brakes of the entire train. The air pump is a direct-coupled compressor whose steam and air cylinders have a common piston-rod, attached in vertical position to the side of the boiler in front of the cab. The cylinder diameter is eight to ten inches. It pumps air into the main reservoir, a cylindrical tank hung under the boiler. An automatic pressure governor starts the compressor when the pressure falls and stops it when the full reservoir pressure is restored.

The locomotive brake equipment consist of brake cylinder and lever system connected to the wheel brake-shoes, but its valve control differs somewhat from that of a car, so as to permit braking the engine alone if desired. The engineer's valve is a flat-seat rotary valve with positions for supplying brakes, recharging the train-pipe, and closing all connections. A separate valve is usually supplied to operate the engine brake alone, working this as "straight-air" or non-automatic brake. Reservoir and train-pipe gauges are mounted in the engine cab near the brake handles. Steam brakes are no longer fitted on American locomotives. The driving-wheels only of the locomotive are braked, but the tender is fully braked.

The sand-box for increasing the driving-wheel friction on wet or greasy rail is commonly set on top of the boiler with discharge pipes ending in front of the drivers just above the rail. A compressed-air ejector is now often used (pneumatic sander), in which case the sand-box may be placed on the front sill or in other convenient position with equal effectiveness.

The Cab, with windows in front and sides, is built around the fire box, providing a seat on either side which commands a view ahead over the track. The reverse lever is placed on the right-hand, or engineer's side, from where also the throttle lever and brake-valve handles are reached. Injector, whistle, sander, bell, drain cocks, traction-increaser, and other appliances are controlled from here. The headlight, set on top of the boiler in front of the stack, is usually an oil lamp, with parabolic reflector. Acetylene and electric headlights are extensively used in recent years, the latter supplied by a small steam-turbine and dynamo combination.

Classes and Types of Locomotives.—The wheel-arrangement of a locomotive is, in conjunction with its total weight, the chief characteristic. Freight locomotives, running at

slow speeds, utilize a large adhesion, and therefore have a large proportion of their weight carried on drivers; they have less need for good guiding quality and steadiness at great speeds. Passenger locomotives, working at high speeds, develop a much lower tractive force, and therefore require less weight on drivers, but need leading wheels for guiding quality and steadiness.

The number and arrangement of cylinders is another characteristic of classification. Most locomotives have two cylinders, both simple. Compounds are built with two, three or four cylinders.

Recent Developments.—The chief factor in the modern modification of locomotive types and details is increase of size. The only limiting factors are boiler capacity and weight on drivers.

Economy of operation has brought compounding into much favor even for single-frame engines, and more recently has led to the wide adoption of super-heating; these improvements also allow increased power to be obtained from a boiler of given size.

Weight and Power.—Locomotives weighing seventy-five to one hundred and twenty-five tons (without tender) are common. In power, road locomotives range from three hundred to one thousand five hundred horse power and occasionally to two thousand horse power, the more modern ranging from seven hundred to one thousand five hundred. High-speed passenger locomotives are usually more powerful than heavier freights.

Boiler Performance.—The distinguishing feature of the locomotive boiler is its high evaporative capacity, and the very high rates of fuel-burning. At full power one hundred pounds coal are burned per square foot of grate surface per hour, by virtue of the strong draft produced by the exhaust-steam blast. At moderate speeds twenty-five to forty pounds are burned.

Electric Locomotives.—The operation of heavy railroad service (*i.e.* trains of freight cars and long passenger trains) by electric power requires the use of electric locomotives in place of the car-motor arrangement of street railroads. Such locomotives have been built since the middle of the nineties, and in considerable number since 1905. The earlier ones had the motors geared to the axles, or directly mounted threron, but recent constructions have the motors mounted on the frame or platform, above the wheels, so that their weight is carried by the frame springs, and the motors drive the wheels through coupling-rods either direct or by way of an intermediate jack-shaft. This form is found to give smoother running and exert less destructive effect on the track than the prior forms. In wheel arrangement these locomotives vary greatly, but recent machines exhibit combinations of coupled drivers with leading and trailing trucks not unlike the arrangement of steam locomotives. Electric locomotives of two thousand to three thousand horse power have been built, and are in regular use hauling trunk-line trains.

AEROPLANES

Flying-machines are distinguished from balloons and dirigibles in being "heavier than air," and consequently raised and supported by dynamic means alone, by the reaction of the air on surfaces driven through it.

Essentially, the aeroplane may be compared to a kite in which the pull of the string is replaced by the thrust of the propeller.

Before it was possible to produce a power-driven aeroplane, experiments over a long course of years were made with aeroplanes not provided with propelling apparatus. Although the first practicable flying-machine was built and flown so long ago as 1809 by Sir George Cayley, in England, no definite results were achieved until the last decade of the 19th century. Progress was so long delayed by two causes: first, the lack of information relating to the laws of air resistance; and, second, the want of suitable motive power of sufficient lightness. The lightest motor known to Sir George Cayley—Boulton and Watt's steam engine—weighed but little under 200 lb. per H.P. It was not until the development of the internal combustion engine, which, in its latest form, weighs as little as 3 lb. per H.P., that power-driven flight became possible.

In its earliest form the aeroplane consisted of a flat surface moved through the air in a position slightly inclined from the horizontal; in its forward movement the plane experiences resistance from the air. As this resistance is directed partly on the under side, it will be partly converted into a lifting force. Of these two forces—head resistance or drift, and the lifting or sustaining force or lift—the first, being unproductive, must be reduced as far as possible; the second, lift, must, on the other hand, be raised to the highest possible degree.

The end is achieved by employing, instead of flat surfaces or planes, surfaces curved in the direction of flight.

The Two Types—A *monoplane* is a machine with a single spread of surface supporting it. The best known example of a monoplane is the Bleriot. *Biplanes* have two supporting surfaces, the one above the other; the Wright and Farman machines are machines of this type.

The monoplane and the biplane have both their own special uses. The monoplane is obviously the lighter machine, and its head resistance is much less, hence it follows logically that its speed will be greater than that of a biplane. But the biplane is a much more stable machine than the monoplane; it will therefore probably be safer and will certainly be able to carry a greater weight.

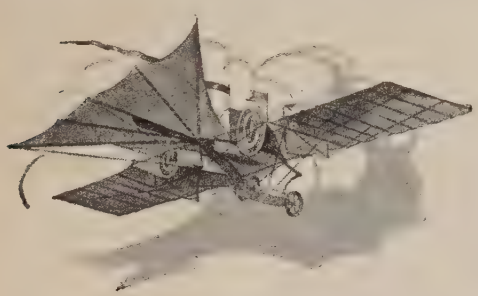
In the making of aeroplanes wood is usually used for the framework. Specially selected wood is taken, usually from the spruce, hickory, ash, or birch, since wood combines in itself the strength and tenacity of metal without its weight. The body is mounted on a chassis, or carriage, rolling on pneumatic-tired wheels protected by skids. The fabric for covering the surfaces is usually rubber-proofed to render it impervious to air, and to protect it from moisture. Generally, the body is also covered in with fabric so as to diminish air-resistance to the lowest possible degree. Modern design tends as far as possible to eliminate wires in construction, since their vibration, in flight, produces enormous head-resistance. In this particular the biplane suffers from disadvantage compared

to the monoplane, in which the only wires employed are those used to stay the wings, and even for this purpose steel ribbons are often substituted.

The biplane carries a load of from two and one-half to three and one-half pounds per square foot of surface; the monoplane from three and one-half to six pounds per square foot. The load per horse power in each case is from thirty to forty pounds. In speed the biplane ranges from thirty-five to forty-five miles per hour, as against sixty to one hundred miles per hour attained by the monoplane.

The aeroplane may be started into the air by two different methods. In the former, due to the Wrights, the machine, provided with runners or skids, is shot along a temporary rail by the action of a heavy weight caused to fall from a tower or derrick. The second method, originating in France, is to run the machine on wheels along the ground until it has gained sufficient velocity to rise, which is often accomplished within less than 100 feet. For landing, the majority of aeroplanes are provided, in addition to wheels, with skids to take the shock.

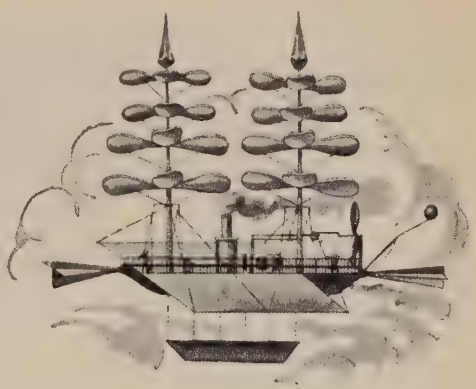
The study of artificial flight can be traced back practically through legendary story to the beginnings of history. During the middle ages we get many attempts to put forward a workable airship or to imitate the flight of birds by means of artificial wings. Leonardo da Vinci put forward theories concerning flight and during the latter part of the seventeenth century and the beginning of the eighteenth much research was made concerning the theory of flight. Much experiment was done with artificial wings and with aerial screws. To Sir George Cayley is given



Henson's aerostat had planes and two propellers

the credit of being the inventor of the modern aeroplane. His machine was described by himself in a paper contributed to *Nicholson's Journal* in 1809, and in the following year he produced the apparatus itself—at first without a motor, but later with a motor as well. The invention, however, was not successful, and during the trials the machine met with disaster.

The next attempt at aviation that we hear of is in 1843, when Henson, by a combination of aerial screws and supporting surface, tried to complete a successful machine. The attempt was not a success, although it was followed up in the succeeding years by many other attempts, especially by his partner, Stringfellow. During the years which followed many attempts to solve the problem of aerial flight were made, but none of them met with great success.



De la Landelle's machine had eight screws to lift it

The science of aerodynamics, which even now is only at its beginning, was developed during the latter part of the nineteenth century by Sir Hiram Maxim, and Professor Langley, an American physicist. By 1896 the experiments of Langley had been so far successful that he made an aeroplane which, although it did not by its own effort lift itself from the ground, flew for a distance of about half a mile along the Potomac River. Further experiments had in the meantime been carried out by Sir Hiram Maxim and N. C. Ader. The former to a very great extent helped to solve the problem of light motors by producing in 1894 an aeroplane with an engine which weighed not quite 2 lbs. per 1 H. P. But in spite of this the aeroplane failed to fly. Ader seems to have been the first inventor to produce a machine which lifted itself from the earth by its own effort. The first aeroplane flight may be said to have taken place at Satory in 1896, when Ader's machine lifted itself by its own power and flew for about 350 yards.

In the meantime experiments were being made with soaring machines and gliders. The chief name to be mentioned in connection with this movement is that of the Berlin engineer, Otto Lilienthal, who, with an arrangement formed on the plan of birds' wings, attempted to imitate their "soaring flight." These wings were made of a light framework covered with a light fabric with two rudders in the rear. In the center of the framework Lilienthal was poised, and with an apparatus of this description he made over 2000 flights in safety. He met his doom while using a biplane glider, falling from a height of about 80 metres and breaking his neck.

These experiments were further carried out by Chanute in New York; he introduced several new ideas. The experiments were also continued at the beginning of the present century by the brothers Wright. These two young Americans, Orville and Wilbur, were originally cycle makers of Dayton, Ohio. They followed up the ideas which had already been promulgated by Lilienthal and Chanute. The result of these experiments was that in 1903 the brothers Wright

THE PLANE THAT CIRCLED THE NORTH POLE

On May 9, 1926, Lieut. Com. Richard E. Byrd, U. S. N., with Floyd G. Bennett, pilot, in the airplane Josephine Ford, a triple-engined Fokker, left Kings Bay, Spitzbergen, and flew to the North Pole and back in 15 hours, 51 minutes. They circled the Pole several times but dropped no flags, and found open water. Byrd's trip was made on a bee-line from Amsterdam Island to the Pole (got there about 9:15, A. M.), thence a bee-line to Verlegen Hook, New Friezeland, thence west to Amsterdam Island and home.

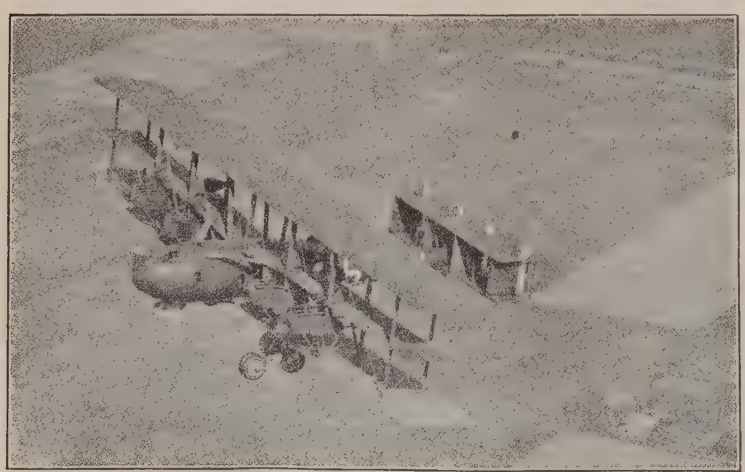
produced their first aeroplane. The first invention of the Wrights was simply an aeroplane that flew in a straight line, but this received many modifications, and in 1908 they went to France to carry on experiments there. During the experiments Wilbur Wright created a record by remaining in the air for over an hour while carrying a passenger.

During this period, however, great strides had been made by many other inventors. Farman had succeeded in producing a machine with which he remained in the air for nearly forty-five minutes, and he was closely followed, and sometimes surpassed, by the Frenchman Leon Delagrange. The best results, however, were undoubtedly attained by the brothers Wright, who succeeded in remaining in the air for nearly two and one half hours.

The year 1909 may be taken as the real era of the beginning of successful aviation. In that year records were made only to be broken, and the ultimate success of the monoplane and biplane was proved by many successful experiments. On July 25, 1909, Bleriot flew the British Channel, a feat which has now become commonplace; this flight was made on a monoplane, but in the same year, Farman covered a distance of nearly 140 miles in four hours on a biplane.

The last twenty years has seen remarkable development in both aeroplanes and aviation. After the strong impetus given to various type of planes during the world war in which the fast-flying scouts and armored planes were chiefly featured, the development then turned toward commercial craft and the expansion of airways for mails, passenger-carrying, and other forms of transportation. Indeed, as stated by Rudyard Kipling:

"The time is here when men will receive their normal impressions of a new country suddenly and in plan, not slowly, and in perspective; when the most extreme distances will be brought within the compass of one week's—one hundred and sixty-eight hours'—travel; when the word inaccessible, as applied to any given spot



THE GREAT BARLING BOMBER

This is the largest bombing plane in the world. Designed and built for the U. S. Government by Walter H. Barling, our Chief Engineer. Has six engines, a total of 2,500 horse power and consumes more than 1,000 pounds of fuel per hour.

THE VOYAGE OF "WE"—COL. LINDBERGH AND HIS "SPIRIT OF ST. LOUIS"

On May 20, 1927, Charles A. Lindbergh, then Capt. U. S air mail service, left Roosevelt Field, L. I., N. Y., at 7:52 A.M., alone, in a Ryan monoplane, "The Spirit of St. Louis" on his way to Paris, France, in an attempt to win the $25,000 prize offered by Raymond Orteig for the first non-stop flight between New York and Paris. At 7:45 P.M. his plane passed over St. Johns, Newfoundland, and headed out to sea. At 1 P.M., May 21, the plane flew over Tralee Bay, Ireland, and at 5:21 P.M. (10:21 P.M., Paris time) it landed safely at the Le Bourget flying field just outside Paris, having gone 3,610 miles in 33 hours, 29 minutes, 30 seconds. After his return to the United States, another brilliant non-stop flight by Colonel Lindbergh and his faithful "Spirit of St. Louis" was made from Washington, D. C., to Mexico City, on to Central and South America, West Indies, and thence to the United States. At this writing, January 12, 1928, the "Spirit of St. Louis" has flown about 40,000 miles. The white zigzag line in the above diagram shows the course of this remarkable flight.

on the surface of the globe, will cease to have any meaning."

The recent astounding flights of Charles A. Lindbergh, Richard E. Byrd, Clarence Chamberlain, and others in 1926 and 1927, have inaugurated a new era in aviation that is prophetic of manifold uses of the aeroplane, with a maximum of safety.

THE MODERN AIRSHIP

The development of the balloon began in 1783, and was the work of two brothers, Joseph and Etienne Montgolfier, who were the sons of a paper manufacturer of Annonay, France.

From the year 1897 the development of the airship was the special work of the Count Zeppelin. In 1900 he made his first flight with a dirigible balloon which carried five men. It was made of aluminum, supported by gas bags and driven by two motors, each about sixteen horse power. In the meantime many other experiments had been carried out, notably by Santos Dumont, who circled the Eiffel Tower in the face of a fresh wind.

Dirigibles are divided into three types—(*a*) *rigid*, in which there is a framework or skeleton, over which a skin is stretched and within which a number of balloons are placed; (*b*) *semi-rigid*, in which the lower part only of the balloon is distended on a flat framework; and (*c*) *non-rigid*, when a gas-bag of elongated form has a long girder suspended below it. The propellers are most usually mounted in pairs on each side of the car, but Zeppelin attached them to the balloon itself. To prevent pitching, an "empennage" of flat surfaces is usually arranged near the after-end.

The whole frame is covered externally with a strong fabric, which forms the outer skin or wall of the hull. Air-spaces naturally exist between this covering, the inflated balloonettes, and the wheel-like divisions. The entire airship owes its buoyancy to the balloonettes filled with hydrogen, while the outer framework and covering act as a protection against the sun, foul weather, and external shocks. In shape an ordinary Zeppelin airship is a long cylinder with semisphere-like ends and a keel running the whole length of the bottom thereof. In appearance from a distance the cylinder and pointed ends appear circular in shape, *i.e.* in cross-section, but in reality this is not so, both being sixteen sided. About one-third the distance from either end of the keel are small boat-like structures suspended from the hull, so close to it that at these places there is a gap in the hull to make room for them. They are rigidly connected with the metallic hull of the airship and help to support it either when the vessel rests on the ground or is towed or driven along the water.

Within these structures are the screw and engines, while above, but outward on each side of the rigid hull and connected with it by means of outriggers, are two pairs of aërial propellers. These are placed at an equal distance out on either side and in the same horizontal plane, so that their united propulsive action shall act centrally along the line of head resistance. The crew can walk through the keel (originally V-shaped) from end to end, or from one boat to the other, the passage being illuminated by means of suitable windows. An observer can also climb through the hull to take observation from the top. Telephones, electric bells, and speaking-tubes are all employed to transmit orders.

Aeroplane versus Airship.—On the airship's side the following strong points are claimed: (1) Greater manœuvering power than the aeroplane, more especially with respect to rapidity of ascent; (2) greater offensive power, *i.e.* ability to carry heavier guns owing to its far greater lifting capacity; (3) ability to stand still or hover in the air over one spot (for bomb-dropping); (4) greater flying durability, *i.e.* ability to remain longer in the air at a stretch; (5) ability to fly at night.

THE SUBMARINE

Though the submarine boat has only recently been brought to a high degree of practical efficiency, its history extends back to the seventeenth century, and even beyond. The modern submarine, however, whether of the American, English, or German type, has followed the model of J. P. Holland, an American inventor who submitted designs to the United States government in 1895.

Germany started with *Hollands*, which they have developed along their own lines. The submarine boat is found in all navies now, and has proved an enormously efficient craft; displacements of one thousand tons are not unusual and speeds as well as radius of action have shown great improvement.

There are two distinct types of submarine vessel—the submarine proper, and the submersible. The submarine sinks through the exhaustion of all its buoyancy, and she sinks at once; the submersibles are forced under.

The latter, though equipped to travel on the surface of the water, are specially equipped for sinking quickly out of sight as the occasion arises. The most improved types, such as the recent German U-boats, have lofty armor plated conning towers, torpedo tubes, mounted guns, periscopes, and wireless equipments.

The present-day submarine suffers from two serious drawbacks: (1) inability to see under the water; (2) inefficient speed—the latter being much slower compared with the speed of fast surface boats. The chief chance of a submarine attacking an enemy with success is to come upon him unawares.

The periscopes and other optical tubes with which submarines are fitted, suffer also from many disabilities; and the fact that many collisions have occurred while using them, shows that they are not yet perfect. Obviously one showing not only what is forward of the submarine but what is on the surface of the water on every side is best. One of the drawbacks from which they suffer is the encrustation of salt on their reflecting surfaces; and small though the exposed surface of the periscope may be, there is always the chance of a vigilant enemy detecting it.

The Submarine in Peace.—It is pleasant to record that this invention, like many others of its kind, has not been devoted solely to war, but that peace also can claim its services. The recent remarkable trans-Atlantic voyages of the German submarine *Deutschland* to American ports is an illustration of their importance to commercial transportation under critical conditions. Since, too, the submarine can sink or dive down to moderate depths, it is obvious it can be used for purposes of underwater salvage, construction, and exploration.

As an aid in the construction of breakwaters, the blowing-up of submerged wrecks in comparatively shallow waters, in searching for sunken treasures, and as an aid to marine explorations in suitable waters, the peace or working submarine is likely to be of untold value.

ELECTRICITY

How may electricity be called into activity?

By *mechanical power*, by *chemical action*, by *heat*, and by *magnetic influence*.

What is the most ordinary way of exciting electricity?

By *friction*.

Do we know any reason why the means above enumerated should develop electricity from its latent condition?

We are *entirely ignorant* upon this subject.

When you rub a piece of paper with India-rubber, why does it adhere to the table?

Because the *friction* of the India-rubber against the surface of the paper develops *electricity*, to which this adhesiveness is mainly to be attributed.

Does electricity present any appearance by which it can be known?

No; electricity, like heat, is in itself *invisible*, though often accompanied by both *light* and *heat*.

When a substance, by friction or by any other means, acquires the property of attracting other bodies, in what state is it said to be?

It is said to be *electrified*, or *electrically excited;* and its motion towards other bodies, or of other bodies towards it, is ascribed to a force called electric attraction.

Does an electrified body exercise any other influence than an attractive one?

It *does;* for it will be found that light substances, after *touching* the electrified body, will *recede from it* just as actively as they approached it before contact. This is termed *electric repulsion.*

Thus, if we take a dry glass rod, rub it well with silk, and present it to a light pith ball, or feather, suspended from a support by a silk thread, the ball or feather will be attracted towards the glass. After it has adhered to it a moment, it will fly off, or be repelled. The same will happen if sealing-wax be rubbed with dry flannel, and a like experiment made; but with this remarkable difference, that when the glass repels the ball, the sealing-wax attracts it, and when the wax repels, the glass will attract. These phenomena are examples of *electrical attraction* and *repulsion.*

What is a non-electrified body?

One that holds its own natural quantity of electricity *undisturbed.*

What happens when an electrified body touches one that is non-electrified?

The electricity contained in the former is *transferred* in part to the latter.

Thus, on touching the end of a suspended silk-thread with a piece of excited wax, the silk will be excited, as will be shown by its moving towards a book, piece of metal, or any other object placed near it.

Do all bodies conduct or allow electricity to pass through them equally well?

Although there is no substance that can *entirely prevent* the passage of electricity, nor any that does not oppose *some resistance* to its passage, yet it moves with a much greater facility through a certain class of substances than through others. Those substances which facilitate its passage are called conductors; those that retard or almost prevent it, are called non-conductors.

What substances are good conductors of electricity?

The *metals*, *charcoal*, the *earth*, *water*, and *most fluids*, except oils, the *human body*, etc., are good conductors.

What substances obstruct the passage of electricity, or are "non-conductors"?

Glass, *resin*, *oil*, *silk*, *sulphur*, *dry air*, etc., etc., are non-conductors.

What is an electrical machine?

An electrical machine is an arrangement by which quantities of electricity can be collected and discharged.

One type of the electrical machine most usually employed consists of a large circular plate of glass, mounted upon a metallic axis, and supported upon pillars fixed to a secure base, so that the plate can, by means of a handle, be turned with ease. Upon the supports of the glass, and fixed so as to press easily but uniformly on the plate, are four rubbers; and flaps of silk, oiled on one side, are attached to these, and secured to fixed supports by several silk cords. When the machine is put in motion, these flaps of silk are drawn tightly against the glass, and thus the friction is increased, and electricity excited.

Do we know what electricity is?

No; a complete and final answer to this question is no more possible than the answer to the question—what is *life?* The *theory* of electricity, however, opens up possibilities of the most fascinating nature; it gives us a wonderfully clear conception of which might be called the inner mechanism of electricity; and it even introduces us to the very atoms of electricity.

Give a short outline of the theory of electricity.

EARLY THEORIES.—Early writers on the nature of electricity supposed it to be either a fluid of peculiar properties or else two fluids whose properties were complementary to each other or of opposite kinds; Franklin held the *one fluid* theory. Later physicists arrived at the conclusion that whatever electricity might be, it was not a material substance. As an

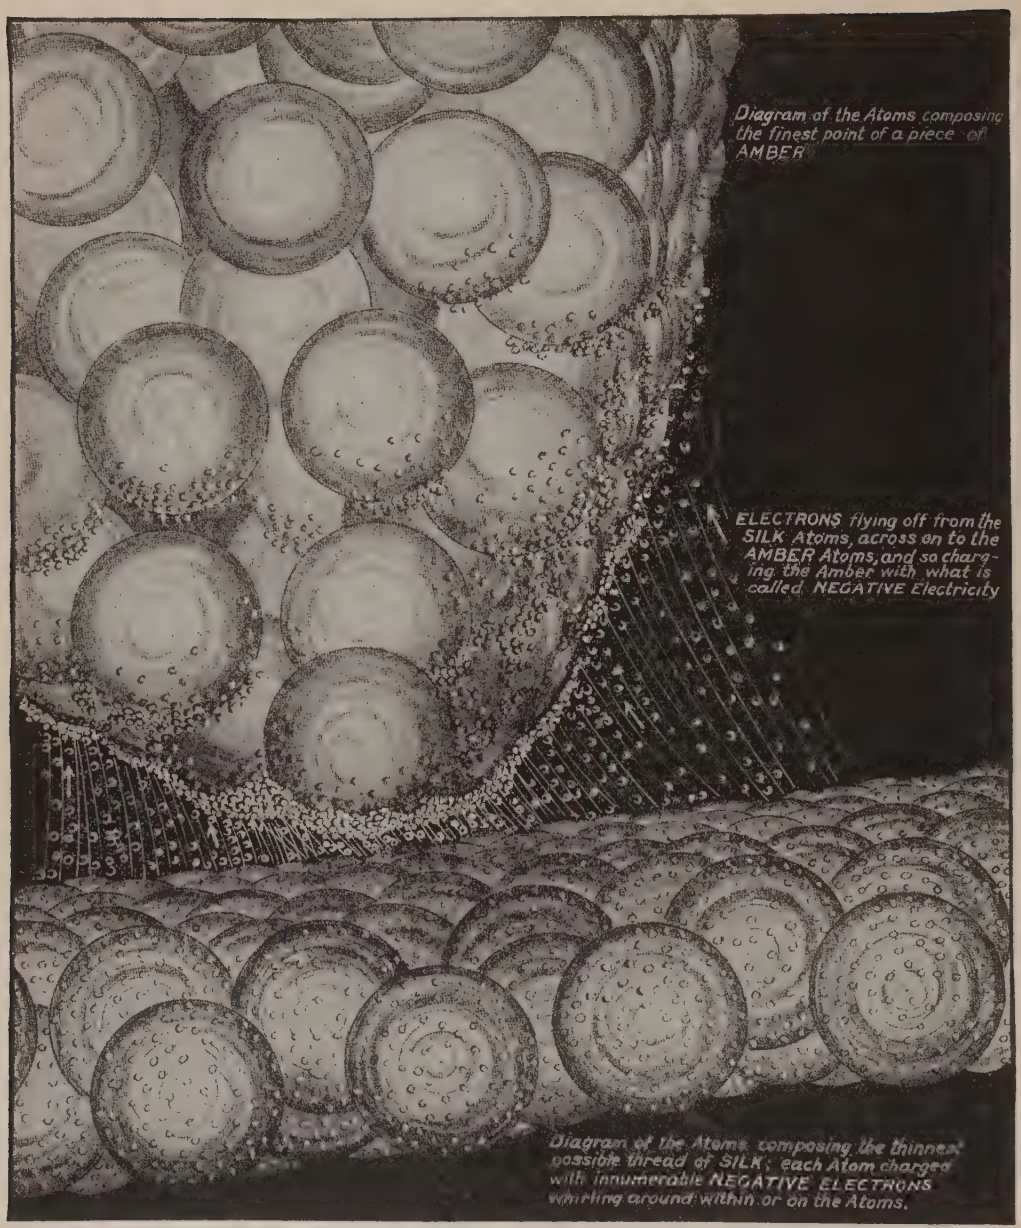

Diagram of the Atoms composing the finest point of a piece of AMBER
ELECTRONS flying off from the SILK Atoms, across on to the AMBER Atoms, and so charging the Amber with what is called NEGATIVE Electricity
Diagram of the Atoms composing the thinnest possible thread of SILK; each Atom charged with innumerable NEGATIVE ELECTRONS whirling around within or on the Atoms.

HOW ELECTRICITY IS PRODUCED BY THE ACTIVITY OF ELECTRONS

alternative it was suggested that electricity was a form of energy, but this proved untenable.

Electron Theory.—This, with certain reservations, is held by the scientific world of today. All matter is believed to be constituted of minute particles called "atoms," whose diameter has been estimated at about one millionth of a millimeter. Up to a few years ago the atom was believed to be quite indivisible, but it has been proved beyond doubt that this is not the case. An atom may be said to consist of two parts, one much larger than the other. The smaller part is negatively electrified, and is the same in all atoms; while the larger part is positively electrified, and varies according to the nature of the atom. The small negatively electrified portion of the atom consists of particles called "electrons," and these electrons are believed to be indivisible units or atoms of negative electricity.

The electrons in an atom are not fixed, but move with great velocity, in definite orbits. They repel one another, and are constantly endeavoring to fly away from the atom, but

they are held in by the attraction of the positive core. So long as nothing occurs to upset the constitution of the atom, a state of equilibrium is maintained and the atom is electrically neutral; but immediately the atom is broken up by the action of an external force of some kind, one or more electrons break their bonds and fly away to join some other atom. An atom which has lost some of its electrons is no longer neutral, but is electro-positive; and similarly, an atom which has gained additional electrons is electro-negative.

THE ELECTRIC CURRENT.—A current of electricity is believed to be nothing more or less than a stream of electrons, set in motion by the application of an electro-motive force. Some substances are good conductors of electricity, while others are bad conductors or non-conductors. In order to produce an electric current, that is a current of electrons, it is evidently necessary that the electrons should be free to move. In good conductors, which are mostly metals, it is believed that the electrons are able to move from atom to atom without much hindrance, while in a non-conductor their movements are hampered to such an extent that interatomic exchange of electrons is almost impossible.

Does electricity seem to exist in two different states or conditions?

It does; and to designate these two conditions, the terms positive and negative have been employed. Thus a body which has an overplus of electricity is called positive, and one that has less than its natural quantity is called negative.

Do light, heat, and electricity appear to have some properties in common?

They *do;* each may be made, under certain circumstances, to *produce* or *excite* the other. All are so light, subtle, and diffusive, that it has been found impossible to recognize in them the ordinary characteristics of matter. Some suppose that light, heat, and electricity are all *modifications* of some common principle.

Why does the fur of a cat sparkle and crackle when rubbed with the hand in cold weather?

Because the friction between the hand and fur produces an excitation of *positive electricity* in the *hand* and *negative* in the *fur*, and an interchange of the two causes a spark, with a slight noise.

Why does this experiment work best in very cold weather?

Because the air is then *very dry*, and does not *convey away* the electricity as fast as it is excited; if the air, on the contrary, were *moist*, the electricity would be *conducted off* nearly as fast as it was excited by friction, and its effects would not therefore be so manifest.

With what velocity is electricity transmitted through good conductors?

With a velocity so great that the most rapid motion produced by art appears to be actual rest when compared to it. Some authorities have estimated that electricity will pass through copper wire at the rate of *two hundred and eighty-eight thousand miles in a second* of time—a velocity greater than that of light.

What agents are undoubtedly the most active in producing and exciting electricity in the operations of nature?

The *light* and the *sun's rays.*

Do some animals have the power of exciting electricity within themselves?

There *are* certain animals which are *gifted* with the extraordinary power of *producing electrical phenomena* by an effort of muscular or nervous energy. Among these the electrical eel and the torpedo are most remarkable.

How powerful a charge of electricity can the electrical eel send forth when in full vigor?

Sufficient to *knock down a man or stun a horse.*

Is the electricity generated by these animals the same as that occasioned by the ordinary electrical machine?

It *is the same*, and produces the *same effects.*

Do vital action and muscular movements in man and animals give rise to electricity?

They *do;* and it can be shown by direct experiment that a person cannot even *contract the muscles of the arm* without exciting an electrical action.

Does change of form or state in bodies generally produce electrical excitation?

Change of form or state is one of the *most powerful methods* of exciting electricity.

Water, in passing into steam by artificial heat, or in evaporating by the action of the sun or wind, generates large quantities of electricity. The crystallization of solids from liquids, all changes of temperature, the growth and decay of vegetables, are also instrumental in producing electrical phenomena.

What is lightning?

Lightning is *accumulated electricity*, generally discharged *from the clouds* to the earth, but sometimes from the earth to the clouds.

What causes the discharge of an electric cloud?

When a cloud *overcharged* with electric fluid approaches another which is *undercharged*, the fluid rushes from the former *into the latter*, till both contain the *same quantity.*

Is there any other cause of lightning besides the one just mentioned?

Yes; sometimes mountains, trees, and steeples will discharge the lightning from a cloud floating near, and sometimes the electricity passes from the earth into the clouds.

How high are the lightning clouds from the earth?

Sometimes they are elevated *four or five miles high*, and sometimes actually touch the earth with one of their edges; but they are rarely discharged in a thunder storm when they are more than seven hundred yards above the surface of the earth.

What is a thunder storm?

The *disturbance* caused in the *air* when successive discharges of accumulated electricity take place.

Into how many kinds has lightning been divided?

Three.

What are they?

The *zig-zag lightning*, *sheet lightning*, and *ball lightning.*

Why is lightning sometimes forked?

Because the lightning cloud is at a *great distance;* and the *resistance of the air* is so great that the electrical current is diverted into a zig-zag course.

How does the resistance of the air make the lightning zig-zag?

As the lightning condenses the air in the immediate advance of its path, it flies from side to side, in order to pass where there is the *least resistance.*

Why is the flash sometimes quite straight?

Because the lightning cloud is near the earth, and as the flash meets with very little resistance, it is not diverted; in other words, the flash is straight.

What is sheet lightning?

Either the reflection of distant flashes not distinctly visible or beneath the horizon, or else *several flashes intermingled.*

FRANKLIN AND HIS KITE

What other form does lightning occasionally assume?

Sometimes the flash is *globular,* which is the most dangerous form of lightning.

Does a discharge produce a flash when it passes through good conductors?

It *does not,* but passes quietly and invisibly.

What is heat lightning?

Sometimes it is the *reflection* in the atmosphere of the lightnings of storms *very remote,* the storms themselves being so far distant that their thunders cannot be heard. This phenomenon is also occasioned by the play of silent flashes of electricity between the earth and the clouds, the amount of electricity developed not being sufficient to produce any other effects than the mere flash of light.

Why is lightning more common in summer and in autumn than in spring and winter?

Because the heat of summer and autumn produces *great evaporation,* and the conversion of *water into vapor* always develops *electricity.*

How long is the duration of a flash of lightning?

Arago has demonstrated that it does not exceed the *millionth part of a second.*

With what velocity is lightning, or the electric fluid which gives rise to its appearance, supposed to move?

Not less than *two hundred and fifty thousand miles per second.*

By whom was the identity of lightning and electricity first established?

By *Dr. Franklin,* at Philadelphia, in 1752.

The manner in which this fact was demonstrated, was as follows:

Having made a kite of a large silk handkerchief stretched upon a frame, and placed upon it a pointed iron wire connected with the string, he raised it upon the approach of a thunder storm. A key was attached to the lower end of the hempen string holding the kite, and to this one end of a silk ribbon was tied, the other end being fastened to a post. The kite was now insulated, and the experimenter for a considerable time awaited the result with great solicitude. Finally, indications of electricity began to appear on the string; and on Franklin presenting his knuckles to the key, he raised an electric spark. The rain beginning to descend, wet the string, increased its conducting power, and vivid sparks in great abundance flashed from the key.

Why was the kite insulated when Franklin fastened the key to the post with a silk ribbon?

Because the silk was a *non-conductor,* and would not allow the electricity received upon the kite to pass off by means of the string to the ground.

Was this experiment one of great danger and risk?

It was; because the whole amount of electricity contained in the thunder cloud was *liable to pass from* it, by means of the string, to the earth, notwithstanding the use of the silk insulator.

Have we any proof of the utility of lightning rods?

The experience of a hundred years has shown that when all the *necessary rules* have been *observed,* the protection is perfect, as far as human effort can avail.

Is a building more or less liable to be struck when furnished with a good lightning conductor?

Lightning conductors do *not,* as many suppose, *attract the lightning toward the building* on which they are situated; they simply *direct its course,* and *facilitate* the *passage* of the *fluid* in the most direct way to the earth, only when a discharge must inevitably occur. There is no attraction, but the lightning takes the road which offers the least resistance.

What is thunder?

It is a certain *noise* proceeding apparently from the clouds, which usually follows, after a greater or less interval, the appearance of a flash of lightning.

How is it supposed to be occasioned?

The usual explanation offered is a *sudden displacement of the air* produced by the electrical discharges in which the lightning is evolved.

Others have supposed that the passage of the electric current creates a vacuum, and that the air rushing in to fill it produces the sound. Any explanation that has yet been offered is not altogether satisfactory.

What occasions the rolling of the thunder?

It has been ascribed to the *effect of echo;* but the true cause probably is, that the sound is developed by the lightning in passing through the air, and consequently separate sounds are produced at every point through which the lightning passes.

Why is thunder sometimes one vast crash?

Because the lightning cloud is *near the earth;* and as all the vibrations of the air (on which sound depends) reach the ear at *the same moment,* they seem like one vast sound.

Why is the thunder generally heard several moments after the flash?

Because it has a *long distance* to travel. Lightning travels nearly *a million* times faster than thunder; if, therefore, the thunder has *a great distance to come,* it will not reach the earth till a considerable time *after the flash.*

Can we not tell the distance of a thunder cloud by observing the interval which elapses between the flash and the peal?

Yes; the flash is instantaneous, but the thunder will take a whole *second of time* to travel three hundred and eighty yards; hence, if the flash be five seconds before thunder, the cloud is nineteen hundred yards off.

i. e. $380 \times 5 = 1900$ yards.

What is the aurora borealis or northern lights?

Luminous appearances seen in the *sky* at night-time. Sometimes streaks of blue, purple, green, red, etc., and sometimes flashes of light, are seen.

What is the cause of the aurora borealis or northern lights?

Electricity in the higher regions of the atmosphere is undoubtedly an active agent in producing this phenomenon.

Is the aurora ever seen in other parts of the heavens than towards the north?

In the northern hemisphere it always appears in the *north,* but in the southern hemisphere it appears in the *south:* it seems to originate at or near the *poles of the earth,* and is consequently seen in its greatest perfection within the arctic and antarctic circles.

What is known concerning the extent of the aurora?

It is not *local,* but it is seen simultaneously at places widely remote from each other, as in Europe and America.

What calculations have been made respecting the height of the aurora?

The height of the appearances varies from *one to two hundred miles;* they sometimes appear within the region of the clouds, and very near to the earth.

Do the auroras appear at any particular seasons and times?

They appear more frequently in the *winter* than in the summer, and are only seen at *night.*

Do they also occur in the day-time?

The aurora is known to *affect the magnetic needle* and the telegraph; and as the effects upon these instruments are noticed by day as well as by night, there can be no doubt of the occurrence of the aurora at all hours. The intense light of the sun renders the auroral light invisible during the day.

Of what utility are the auroral appearances in the polar regions?

During the long polar night, when the sun is absent, the aurora appears with a magnificence unknown in other regions, and affords *light sufficient* for many of the *ordinary outdoor employments.*

Magnetism

Is there any connection between magnetism and electricity?

There is every reason to believe that magnetism and electricity are but *modifications of one force.*

What is a loadstone or a natural magnet?

It is an *ore of iron,* known as the "*protoxide of iron,*" or "*magnetic oxide of iron,*" which is capable of attracting other pieces of iron to itself; and if suspended freely by a thread, and left to take its own position, it will arrange itself so that its extremities will point towards the north and south poles of the earth.

Are natural magnets rare?

They are *not;* they are found in many places in the *United States.* In *Arkansas,* especially, an ore of iron possessing remarkably strong attractive powers is very abundant.

The magnetic ore is usually of a dark gray hue, and possesses but little metallic luster. If a piece of this ore be dipped in iron filings, or a number of small needles, they will generally be found collected and clinging together in great quantities at two opposite extremities, whilst the middle portion is nearly destitute. The magnetic property, whatever it may be, seems therefore to be collected and act with the greatest energy at two opposite extremes; these have been termed *poles.*

What is the origin of the terms "magnet" and "magnetism"?

The loadstone or natural magnet was first found at *Magnesia,* in Lydia, Asia, whence were derived the names.

Can a natural magnet communicate its attractive properties to other bodies by contact?

It *can,* and that too without any *apparent loss* of attractive strength.

What bodies are capable of being magnetized by contact with natural magnets?

Iron and *steel* are the substances most susceptible of this influence, but brass, nickel, and cobalt can also become magnets.

Does the magnetism imparted to a piece of soft iron, or steel, by contact with a natural magnet, remain permanent in their substances?

In the *steel* it *does,* but the soft iron *loses its power* as soon as it is removed from the magnet.

Is it necessary that absolute contact should take place between a magnet and a piece of soft iron to render the latter a magnet?

No, every piece of soft iron brought *near* a magnet becomes by induction itself a magnet.

What do you mean by induction?

It is the production of *like effects* in *contiguous bodies.* In electricity or magnetism, it is the influence exerted by an electrified or magnetized body through a non-conducting medium without any apparent communication of a current.

What is meant by the directive power of the magnet?

It is that power which will cause a magnet, when suspended freely, to constantly *turn the same part* towards the north pole and the opposite part towards the south pole of the earth.

What are the poles of a magnet?

They are the *ends* of the magnet, and are denominated north and south, according as they point to the north or south poles of the earth.

What are the poles of the earth?

The *extremities of the earth's axis,* or the points on the surface of the globe through which the axis passes.

What is a magnetic needle?

Simply a *bar of steel* which is a *magnet,* suspended in such a way that it can *freely turn* to the north or south.

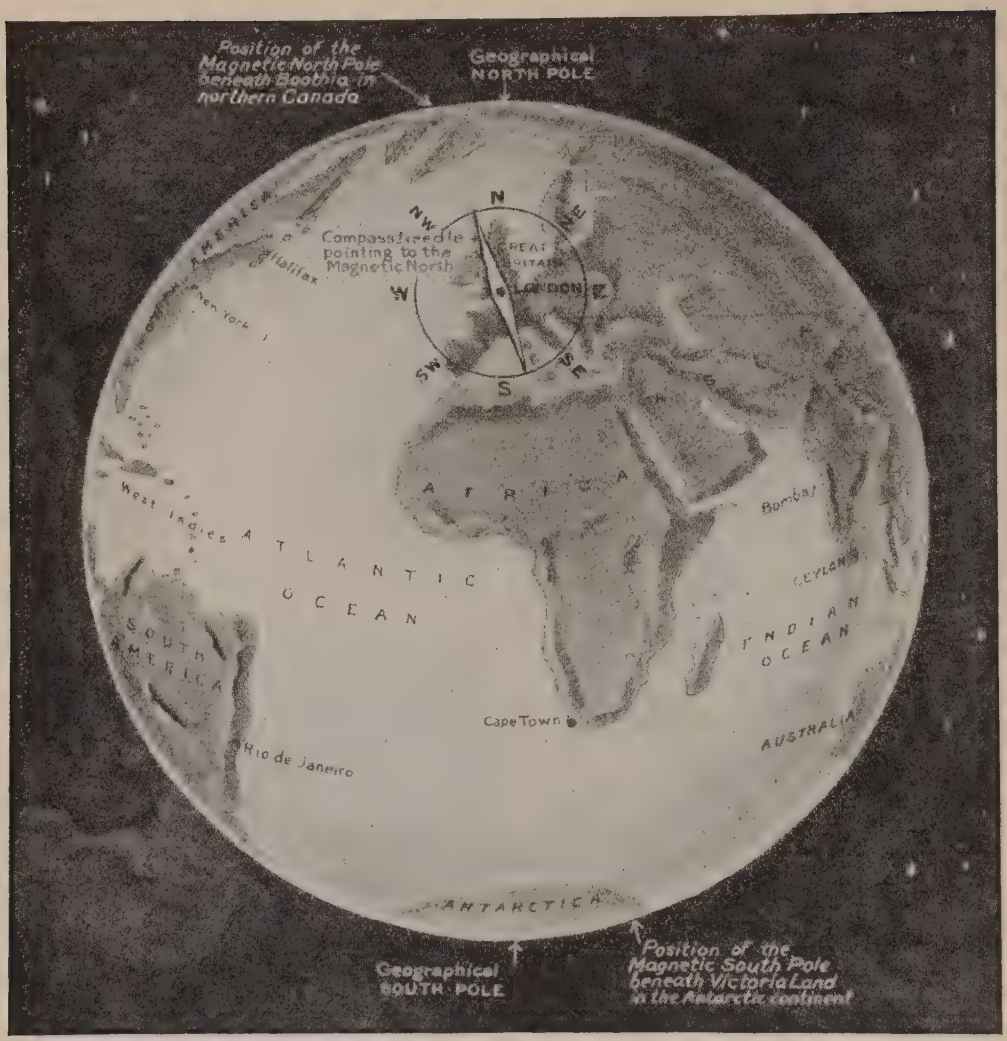

DIAGRAM SHOWING THE VARIATION OF THE MAGNETIC AND GEOGRAPHICAL POLES

What is a mariner's compass?

It is a *delicate steel bar or needle* balanced upon a *pivot* placed beneath its center of gravity in such a way that it can turn horizontally without obstruction. This needle is usually inclosed in a box, upon the bottom of which is a card, with the various points—north, south, east, west, etc., etc., marked upon it.

Such a needle, if the box containing it be placed on a level surface, will generally be observed to vibrate more or less, till it settles in such a direction that one of its extremities or poles will point towards the north, and the other consequently towards the south. If the position of the box be altered or reversed, the needle will always turn and vibrate again, till its poles have attained the same direction as before.

Does the compass needle always point exactly north and south?

It does *not;* its natural direction is towards the north and south poles, but it seldom points due north or south.

Who first discovered the fact that a magnet would invariably point to the north and the south, and made use of this knowledge in constructing a compass?

It is claimed to have been discovered by the *Chinese:* it was known in Europe, and used in the Mediterranean, in the thirteenth century.

How were the compasses of that time constructed?

They were merely *pieces of loadstone* fixed to a *cork*, which floated on the surface of water.

Is the earth itself supposed to be a magnet?

It is undoubtedly a *great magnet.*

Is iron under certain circumstances rendered magnetic by the inductive action of the earth's magnetism?

Most *iron bars* and *rails*, as the vertical bars of windows, that have stood for a considerable time in a perpendicular position, will be found to be *magnetic.*

If we suspend a bar of soft iron sufficiently long in the air, will it assume magnetic properties?

It *will* gradually *become magnetic;* and although when it is first suspended it points indifferently in any direction, it will at last point *north and south.*

How may a bar of iron, such as a kitchen poker, be made immediately magnetic, without resorting to the use of other magnets?

If the bar devoid of magnetism is placed with *one end on the ground*, slightly inclined towards the north, and then struck one *smart blow* with a *hammer* upon the upper end, it will immediately acquire *polarity*, and exhibit the attractive and repellant properties of a magnet.

What is a horseshoe magnet?

It is a *magnetic bar* bent into the *form of a horseshoe.*

When a piece of iron not magnetic is brought in contact with a common magnet, it will be attracted by either pole; but the most powerful attraction takes place when both poles can be applied to the surface of the piece of iron at once. The magnetic bars are for this purpose bent into the shape of the letter U, and are termed *horseshoe magnets.* Several of these are frequently joined together with their similar poles in contact; they then constitute a *magnetic battery*, and are very powerful, either for lifting weights, or charging other magnets.

If we break a magnet across the middle, what happens?

Each fragment becomes converted into a *perfect magnet;* the part which originally had a north pole acquires a south pole at the fractured end, and the part which originally had a south pole, gets a north pole.

If we divide a magnet to the extreme degree of mechanical fineness possible, will the pieces possess magnetic powers?

Each fragment, however small, will be a *perfect magnet.*

Galvanism

What is galvanism?

It is the production of *electrical disturbance by chemical action.*

What is the most simple manner of illustrating the production of this electricity?

If we place a piece of silver on the tongue, and a piece of zinc underneath it, no effect will be produced as long as the two metals are kept asunder; but when their ends are brought together, a *distinct thrill* will pass through the tongue, a metallic taste will diffuse itself, and, if the eyes are closed, a sensation of *light* will be evident at the same moment.

To what is this result owing?

To a *chemical action* developed the moment the two metals touched each other.

The *saliva* of the tongue *oxidizes* a portion of the *zinc*, which excites *electricity*, for no chemical action ever takes place without producing electricity. Upon bringing the ends of the two metals together, a slight current passes from one to the other.

By whom was the production of galvanic electricity first noticed?

By *Galvani*, professor of anatomy at Bologna, Italy, in 1790.

Having occasion to dissect several frogs, he hung up their hind legs on some *copper hooks*, until he might find it necessary to use them for illustration. In this manner he happened to suspend a number of the copper hooks on an iron balcony, when, to his great astonishment, the limbs were thrown into violent convulsions.

On investigating the phenomena what did Galvani discover?

He found that whenever the nerves of a frog's leg were touched by one metal and the muscles by another, convulsions took place on bringing the two different metals in contact.

What is the simplest way of exciting a current of galvanic electricity?

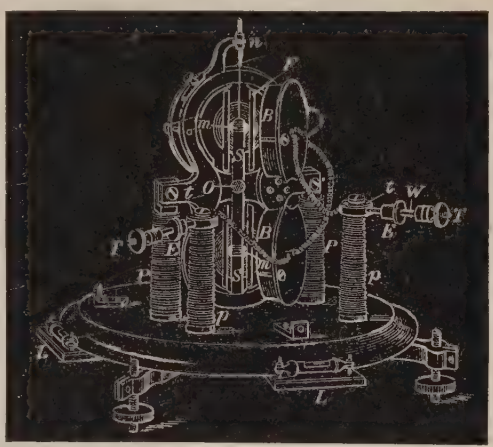
By arranging a *series of metal plates in a pile*, placing them in pairs, with a wet cloth between them, it being necessary that one of each pair should be more easily oxidized than the other. The simple contact of these plates will produce a feeble and continued galvanic current.

What is such an arrangement of plates for producing electrical currents called?

A *galvanic* or *voltaic battery.*

Why are the terms "galvanic" and "voltaic" applied?

They originated in honor of *Galvani* and *Volta*, the Italian philosophers who first developed these phenomena of chemical electricity, and the means of producing them.



HIGH-RESISTANCE GALVANOMETER FOR VERY SMALL CURRENTS

Are there many metals or other substances which, when brought together, are capable of producing galvanic action?

The number is *quite large;* among them we may enumerate the following: *zinc, lead, tin, antimony, iron, brass, copper, silver, gold, platinum, black lead* or *graphite*, and *charcoal.*

Will any two of these brought together produce a galvanic current?

They *will;* but they possess the power in *different degrees;* and the more remote they stand from each other in the order above given, the more decidedly will the chemical electricity be developed.

Thus zinc and lead will produce a voltaic battery, but it will be much less active than zinc and iron, or the same metal and copper, and this last less active than zinc and platinum, or zinc and charcoal.

Does galvanic or voltaic electricity appear to consist of two kinds, positive and negative, as in ordinary electricity?

It does; positive electricity always flows *from the metal which is acted upon* most powerfully, and negative electricity *from the other.*

What do we mean when we speak of a galvanic circuit?

The connection of the two metals in the battery, so that the positive and negative electricities can *meet, and flow in opposite directions.*

At what point in the circuit will the manifestations of electricity be most apparent?

At the point where the *two currents meet.*

What is meant by the poles of the battery?

The two metals forming the elements of the battery are generally connected by copper wires; the *ends* of these wires, or the *terminal points* of any other connecting medium used, are called the poles of the battery.

Thus, when zinc and copper poles are used, the end of the wire conveying positive electricity from the zinc would be the positive pole, and the end of the wire conveying negative electricity from the copper plate would be the negative pole. Faraday describes the poles of

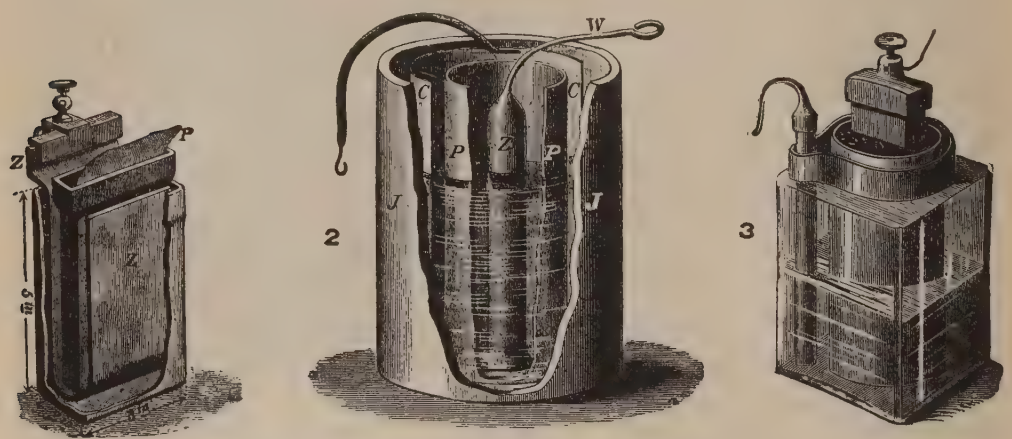
the battery as the doors by which electricity enters into or passes out of the substance suffering decomposition.

A very simple, and at the same time an active, galvanic circuit may be formed by an arrangement as represented in the accompanying illustration. The current of positive electricity, when the circuit is closed, passes from the zinc, through the liquid, to the copper, and from the copper, along the conductors to the zinc. A current of negative electricity traverses the circuit also, from the copper to the zinc, in a direction precisely reversed.

By what chemical action can the greatest abundance of galvanic electricity be developed?

By the *oxidation of metallic zinc* by weak sulphuric acid.

Returning to the voltaic cell, we may imagine that the atoms of the zinc which are immersed in the acid are trying to turn themselves into ions, so that they can travel through the solution. In order to do this each atom parts with two electrons, and these electrons try to attach themselves to the next atom. This atom, however, already has two electrons, and so in order to accept the newcomers it must pass on its own two. In this way electrons are passed on from atom to atom of the zinc, then along the connecting wire, and so to the copper plate.



TYPES OF ELECTRIC CELLS OR "BATTERIES"

(1) *Grove's Cell.*—Z, Zinc plate in dilute sulphuric acid; P, platinum plate in strong nitric acid. (2) *Daniell's Cell.*—Z, Zinc rod in porous pot P containing dilute sulphuric acid; C, copper plate in outer vessel containing copper sulphate solution. (3) *Leclanche Cell.*—Zinc in sal-ammoniac solution; carbon slab in charcoal and manganese dioxide.

The electricity developed by the action of a single pair of plates immersed in acid water is very feeble: how can it be increased?

By increasing the *number of the plates* and the quantity of the liquid, we increase the intensity of the electricity developed.

ACTION WITHIN A VOLTAIC CELL.—Let us try to see now how an electric current is set up in a simple voltaic cell, consisting of a zinc plate and a copper plate immersed in dilute acid. First we must understand the meaning of the word *ion*.

If we place a small quantity of salt in a vessel containing water, the salt dissolves, and the water becomes salt, not only at the bottom where the salt was placed, but throughout the whole vessel. This means that the particles of salt must be able to move through the water. Salt is a chemical compound of sodium and chlorine, and its molecules consist of atoms of both these substances. It is supposed that each salt molecule breaks up into two parts, one part being a sodium atom, and the other a chlorine atom, and further, that the sodium atom loses an electron, while the chlorine atom gains one. These atoms have the power of traveling about through the solution, and they are called *ions*, which means "wanderers."

An ordinary atom is unable to wander about in this way, but it gains traveling power as soon as it is converted into an ion, by losing electrons if it be an atom of a metal, and by gaining electrons if it be an atom of a non-metal.

The atoms of zinc which have lost their electrons thus become ions, with power of movement. They leave the zinc plate immediately, and so the plate wastes away or dissolves. So we get a constant stream of electrons traveling along the wire connecting the two plates, and this constitutes an electric current.

What are the most ordinary effects produced by the developed electricity of a large galvanic battery?

The *production of sparks* and *brilliant flashes of light*, the heating and fusing of metals, the deflagration of gunpowder and other inflammable substances, and the decomposition of water, saline compounds, and metallic oxides.

How may the most splendid artificial light known be produced?

By fixing pieces of *pointed charcoal* or *carbon* to the wires connected with opposite poles of a powerful galvanic battery, and bringing them into *contact*.

What does this produce?

Electric light.

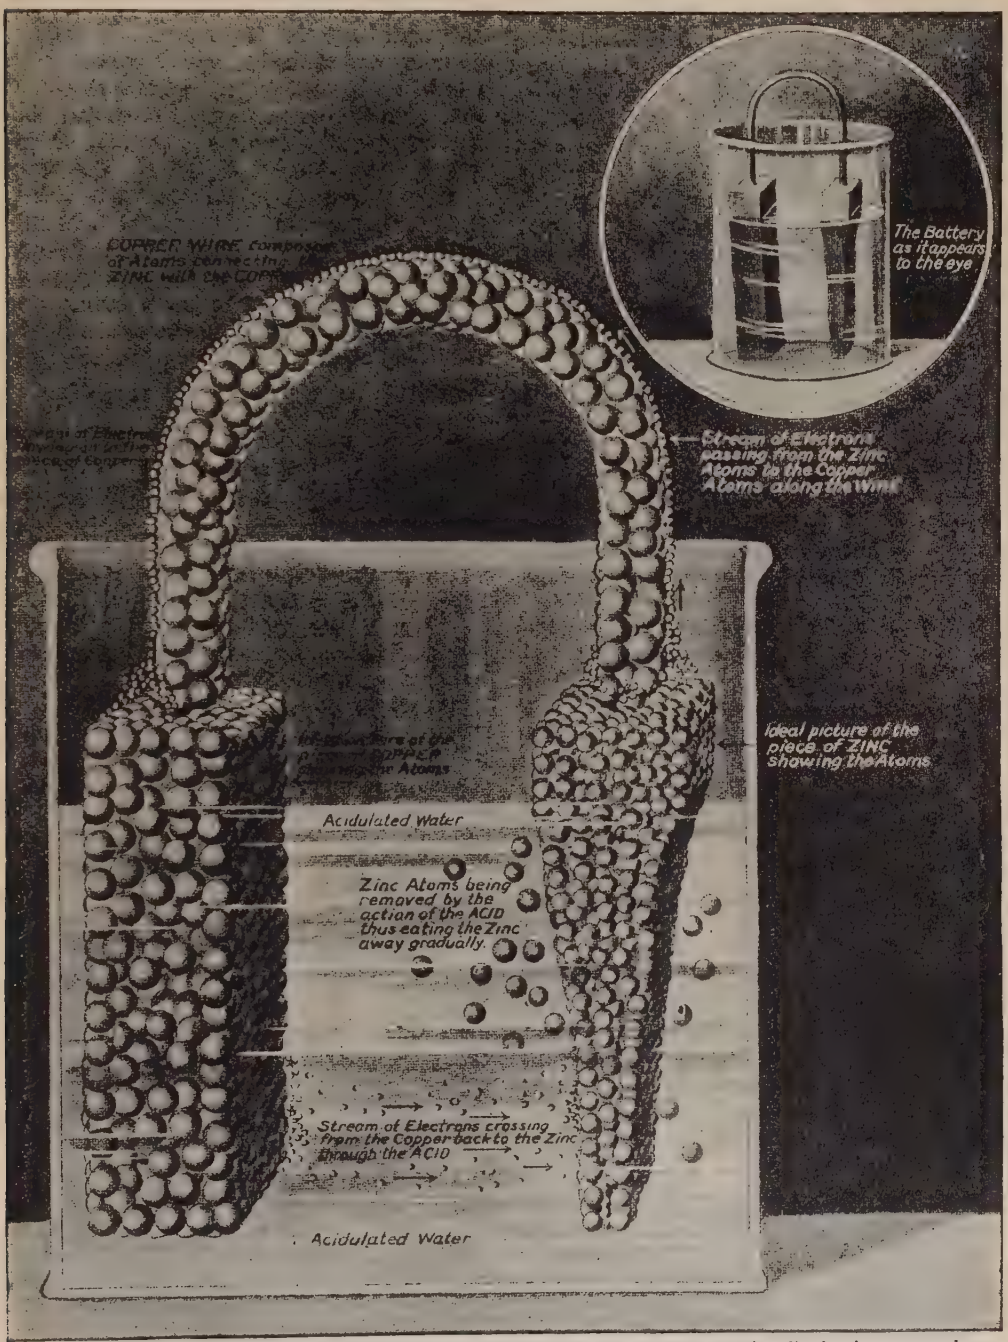
Can intense heat be developed by the action of the galvanic battery as well as intense light?

The *greatest artificial heat* man has yet succeeded in producing has been through the agency of the *galvanic battery*.

What refractory substances can be fused by the aid of the galvanic battery?

All the metals, including platinum, can be *readily melted;* quartz, sulphur, magnesia, slate and lime are liquefied; and the diamond fuses, boils, and becomes converted into coal.

HOW AN ELECTRIC BATTERY GENERATES ELECTRICITY



The Battery as it appears to the eye

Ideal picture of the piece of ZINC showing the Atoms
Acidulated Water
Zinc Atoms being removed by the action of the ACID thus eating the Zinc away gradually.
Stream of Electrons crossing from the Copper back to the Zinc through the ACID
Acidulated Water

The above simple voltaic battery, or cell, consists of a plate of copper and one of zinc dipping into a vessel containing dilute sulphuric acid to twenty of water by volume. When these plates are joined externally by a wire or other conductor a current flows from the copper plates, called the positive pole of the battery, to the zinc plate, called the negative pole of the battery. This is due to the fact that a difference of *potential* is set up between the plates on immersion in the acid, in consequence of which an electro-motive force is generated that drives the current round the circuit. The potential between the plates is maintained by the chemical action now going on in the cell. This action results in the gradual consumption of the zinc plate with formation of zinc sulphate and evolution of hydrogen at the copper plate. In a short time the current in the circuit falls off in consequence of *local action* and *polarization*.

What is electrotyping, or electro-metallurgy?

It is the art or process of *depositing*, from a *metallic solution*, through the agency of galvanic electricity, a *coating* or *film* of metal upon some other substance.

Upon what principles is it accomplished?

The process is based on the fact, that when a galvanic current is passed through a solution of some metal, as a solution of sulphate of copper (sulphuric acid and copper), *decomposition takes place;* the metal is separated in a metallic state, and attaches itself to the negative pole, or to any substance that may be attached to the negative pole; while the acid or other substance before in combination with the metal, goes to, and is deposited on the positive pole.

In this way a medal, a wood-engraving, or a plaster cast, if attached to the negative pole, may be covered with a coating of copper; if the solution had been one containing silver or gold, the substance would have been covered with a coating of silver or gold instead of copper.

How can the thickness of the deposits be regulated?

The thickness of the deposit, providing the supply of the metallic solution be kept constant, will depend on the *length of time the object is exposed to the influence of the battery.*

Electro-Magnetism

What is electro-magnetism?

It is the magnetism developed through the agency of *electrical* or *galvanic action.*

What were the earliest phenomena observed which indicated a relation between magnetism and electricity?

It was noticed that *ships' compasses* have their directive power impaired by lightning, and that sewing needles could be rendered magnetic by electric discharges passed through them.

What discovery, made by Prof. Oersted of Copenhagen, established beyond a doubt the connection of electricity and magnetism?

He ascertained that a magnetic needle placed near a metallic wire connecting the poles of a galvanic battery was compelled to change its direction, and that the new direction it assumed was determined by its position in *relation to the wire* and to the direction of the current *transmitted along the wire.*

Thus, if a needle be inclosed in a wire not touching it at any point, and a current of electricity pass through the wire, the needle will be made to move in accordance with the direction of the current.

What other important discovery was made about the same time?

It was found that if a piece of soft iron, not possessing magnetic power sufficient to elevate a grain weight, be placed within a coil of copper wire through which a galvanic current is passing, it will become, through the influence of the current, a *powerful magnet;* and will, so long as the current flows, sustain weights amounting to many hundreds of pounds.

Is the magnetic power of the bar found to be wholly dependent on the existence of the current?

It *is;* the moment the current stops, the weights *fall away* from the bar in obedience to the law of gravity.

How great weights have been lifted by magnets formed in this manner?

An electro-magnet constructed by Prof. Henry was capable of elevating and sustaining about a *ton weight.*

Upon what principle does the construction of the Morse magnetic telegraph depend?

Upon the principle that a current of *electricity* circulating about a bar of soft iron is capable of *rendering it a magnet.*

Why is it necessary, in conveying the telegraph wires, to support them upon glass or earthen cylinders?

These are used for the purpose of insuring the perfect *insulation* of the wires, since but for this the electricity would pass down a damp pole to the earth, and be lost.

Is there any truth in the idea that many persons have, that some principle passes along the telegraphic wires when intelligence is transmitted?

This supposition is *wholly erroneous;* the word current, as something flowing, conveys a false idea, but we have no other term to express electrical progression.

How can we gain an idea of what really takes place, and of the nature of the influence transmitted?

The earth and all matter are *reservoirs of electricity;* if we disturb this electricity at Boston by voltaic influence, its pulsations may be felt in Chicago. Suppose the telegraphic wire were a tube, extending from Boston to Chicago, filled with water. Now, if one drop more is forced into it at Boston, a drop must fall out at Chicago, but no drop was caused to pass from Boston to Chicago. Something similar to this occurs in the transmission of electricity.

What was the earliest important industrial application of electricity?

One of the earliest industrial applications of electricity was to the driving of street cars. The first electric railway was installed by Siemens, of Berlin, in 1882; and the system was quickly taken up and brought to a high state of development by American engineers. It is remarkable that the system of traction early adopted is the one generally used in America and Europe until the present date. It consists essentially of (*a*) a supply of *continuous current* at five hundred to five hundred and fifty volts, generated in (*b*) a *central powerhouse*, and transmitted to the car by means (*c*) of *overhead conductors*, whence by contact with a trolley wheel on a pole on the car it is led down to (*d*) *two series-excited motors*, which are placed electrically first *in series* with one another *at starting*, and then *in parallel* with one another when a sufficient speed has been attained.

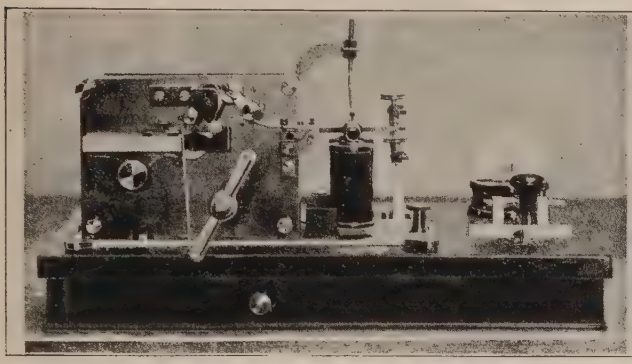
To what well-known electrical machines did this give impetus?

Electric *dynamos* and motors. All such machines will convert the energy of mechanical motion into that of electricity in motion, or the reverse. The former conversion is done by *dynamos*, to which power is given by steam-engines or other such prime-movers, and made to generate in conducting circuits alternate or direct currents of electricity. *Motors*, on the other hand, receive the energy of electrical currents, either alternate or direct, and this produces motion of certain parts of the structure.

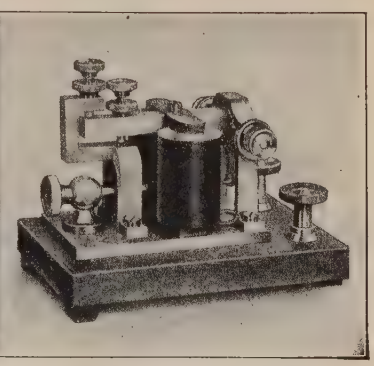
The theory of the action of a dynamo was first discovered by Faraday in 1831; it is intimately associated with that of a motor, for the principle of conservation of energy points out that either machine is reversible—that is to say, a dynamo may be used as a motor or a motor as a dynamo, though perhaps not so efficiently as when each fulfills the special function for which it was designed.

The Current in a Dynamo or Motor.—This brings us to the production of an electric current by the dynamo. In the dynamo we have a coil of wire moving across a magnetic field, alternately passing into this field and out of it. A magnetic field is produced, as we have

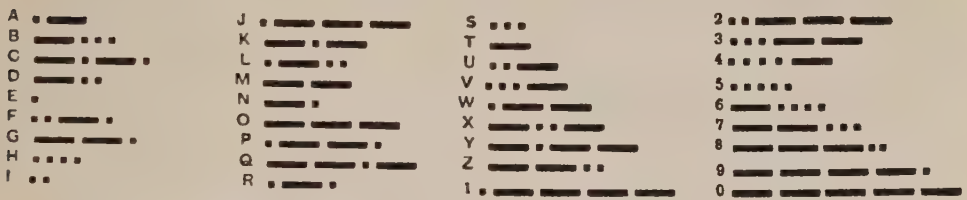
THE TELEGRAPH AND ITS WONDERFUL INSTRUMENTS



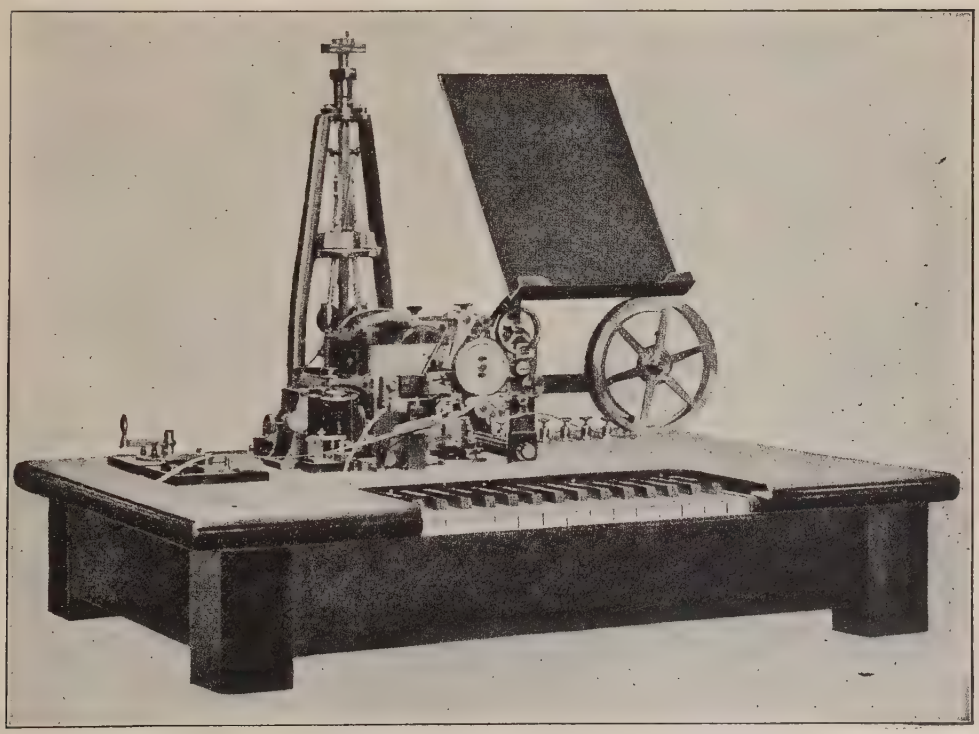
THE MORSE DIRECT INKING PRINTER



THE MORSE SOUNDER

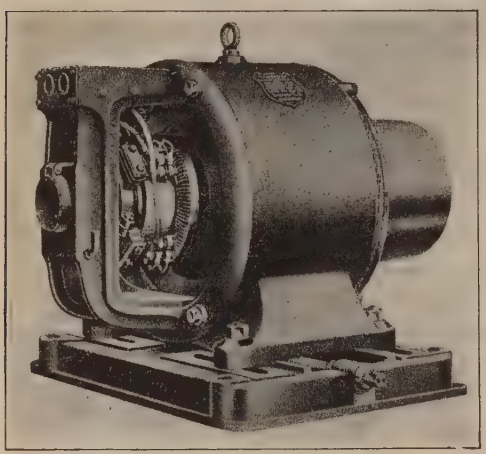


THE MORSE TELEGRAPH CODE FOR LETTERS AND FIGURES



MODERN TELEGRAPHIC TYPEWRITING ATTACHMENT

just seen, by the steady movement of electrons, and we may picture it as being a region of the ether disturbed or strained by the effect of the moving electrons. When the coil of wire passes into the magnetic field, the electrons of its atoms are influenced powerfully and set in motion in one direction, so producing a current in the coil. As the coil passes away from the field, its electrons receive a second impetus, which checks their movement and starts them traveling in the opposite direction, and another current is produced. The coil moves continuously and regularly, passing into and out of the magnetic field without interruption; and so we get a current which reverses its direction at regular intervals, that is, an *alternating* current.



A GOOD TYPE OF DYNAMO

What are some of the chief modern applications of electricity?

The field of applied electricity is one of the most extensive in modern science, invention and industry. Electricity in some form is now utilized in connection with lighting, telegraphy, the telephone, heating, motor boats, railways, aëroplanes, in metallurgy and the arts, clocks, bells and alarms, wireless telegraphy and telephony, submarine telegraphy, automobiles, cooking and domestic science, in medicine and in military science.

Give a brief account of wireless telegraphy.

In the case of ordinary telegraphy we always make use of extended metallic wires or conductors from the place from which the message is sent to the neighborhood to which it is desired to send it. In the case of *wireless* telegraphy no such conductors exist.

Among the most interesting of the many systems of wireless telegraphy now in vogue the modern Marconi, the De Forrest, the Fessenden, and the Poulsen are noteworthy. It is, however, with the name of Marconi that the introduction of wireless telegraphy will always be directly associated.

In 1888 Hertz had demonstrated in a remarkable series of experiments the existence of electro-magnetic waves, and had even shown how these might be produced, detected, and made to exhibit all the chief phenomena of wave-motion. Marconi's great achievement lay in so controlling and regulating the dispatch and receipt of such waves as to make them record signals on a specially designed apparatus in accordance with the well-known Morse telegraphic system. His method, as first patented in 1896, was briefly as follows:

The Transmitter, by which the electro-magnetic waves were generated and sent off into space in all directions, consisted of a battery connected through a key to the primary of an induction coil whose secondary terminals were joined to two brass balls between which there was a short air-gap. From one of these balls a wire was taken to earth, and from the other an aërial wire was led some distance up in the air. The closing of the primary circuit led to sparks passing across the air-gap, which produced electro-magnetic waves in the ether in exactly the same way as the dropping of a stone into a pool produces a series of concentric ripples.

The Coherer.—To receive and interpret these waves Marconi employed a "coherer" in circuit with a battery and having connection with an aërial wire on the one side and an earth wire on the other. The coherer consisted of a small glass tube not more than, say, two inches long by one-quarter inch in diameter, into the ends of which were fused two platinum wires leading to small metallic electrodes. These electrodes were brought quite near each other, and in the narrow gap between them was placed powdered metallic silver, antimony, etc. The resistance offered by this powder was so high, on account of small air-gaps between the particles, that no current could pass through.

Electro-magnetic waves, however, possess the peculiar property of breaking down the resistance of this powder whenever they impinge upon it. Hence as soon as a wave reached the coherer, the resistance practically vanished and a current passed round the circuit. It was a mere detail to arrange that this current should actuate a relay connected with a telegraphic instrument which would record the signal, and that a hammer would at the same time tap the coherer so as to agitate the powder and "decohere" it, setting up the resistance again for a fresh signal.

Improvements.—Since this system was devised many most important improvements have taken place. One of the most noticeable of these was Sir Oliver Lodge's invention of tuning and syntonizing apparatus by which a transmitter and receiver are tuned to the same periodic oscillation, and thus a number of messages might be operated in the same field without interference. Lodge accomplished this to some extent by adding inductance coils and condensers to the circuits. Various other methods have been adopted to secure syntonization; but the resonance effects obtained are not great enough to make selective signaling certain.

The Generator.—In the modern Marconi system the energy for the transmitter is obtained from a generator working at one hundred and ten volts. The current is led through a key and an improved form of interruptor to the primary of the induction coil, whose secondary terminals communicate with the spark-gap. The spark-gap is in series with a condenser and the primary of a high tension transformer, of which latter one secondary terminal leads to the aërial and the other to the earth wire.

THE WIRELESS MESSAGE OVER LAND AND SEA

The Detector.—In the receptor the metallic coherer has been discarded for a magnetic detector. This instrument consists of a small glass tube through which travels an endless band of iron wires, moving round two grooved pulleys. Close to the tube are two permanent magnets, and round it is wound a primary coil consisting of one layer of wire. One end of this coil is led straight to earth; the other passes through a condenser to a tuning inductance coil leading in one direction to earth and in the other to the aërial. Above the primary coil on the glass tube a secondary coil is wound and connects with a telephone receiver. The action is simple. The electro-magnetic waves, reaching the aërial, set up oscillatory currents in the primary which act upon the magnetic field. Currents are thus generated in the secondary, which record the message in the telephone receiver by a series of taps corresponding to the Morse dashes and dots.

The *De Forrest system* is very largely used in the United States, Japan, and elsewhere, and in its more recent modifications secures a high efficiency by means of a number of ingenious improvements.

Describe the wireless telephone.

As in wireless telegraphy, all modern systems of wireless telephony are based upon the action of electro-magnetic waves. It is impossible here to discuss all the various methods that have been devised, but the leading principles employed may be indicated, with special reference to some of the best-known systems. They may be classified according to the methods in which the waves are produced.

Spark Discharge Systems.—These rely for the generation of the Hertzian waves upon a spark discharge across an air-gap. The *De Forrest system* is perhaps the most popular of this type. In this system the spark discharge is utilized to produce waves of a frequency not less than one hundred thousand per second, the resulting sound being inaudible at the receiving station.

A microphone transmitter is employed with this apparatus. When the operator speaks into the transmitter, the variations of resistance act upon the waves in such a way as to produce a new series of waves of such frequency as to be audible at the receiver.

Courtesy of Marconi Wireless Co.

TELEPHONING FROM NEW YORK TO SAN FRANCISCO BY WIRELESS

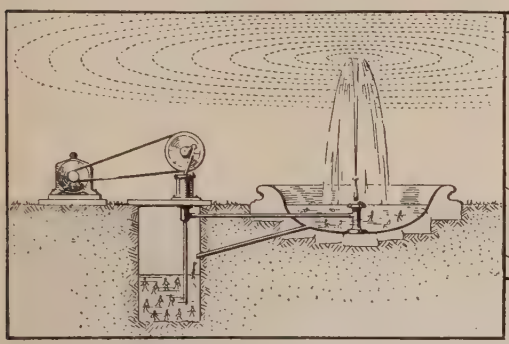
The receiving apparatus includes the usual antenna, and closed secondary circuit, comprising an inductance and a variable capacity, across the terminals of which an Audion delicate detector is introduced. This instrument depends upon the motions of the ions in a rarefied gas. It is one of the most sensitive detectors yet invented, and offers the great advantage of a practically total absence of time lag in recovery.

Singing-Arc Systems.—Duddell's discovery of the singing arc in 1909 has been quickly followed by its application to radio-telephony and radio-telegraphy, first by Poulsen and subsequently by Fessenden, Stone, De Forrest, and others. Under certain conditions the electric arc can be made to emit a musical note, while at the same time it transforms a portion of the energy of its own direct current into oscillations. These are led into an oscillation circuit containing a condenser and inductance, and associated with

HOW RADIO WORKS THROUGH ELECTRONS AND ETHER WAVES

Radio messages are carried from one place to another by what are called radio waves in the ether. The broadcasting station sends out a continual series of ether waves, and a radio receiving set picks up these waves as they pass along through the ether and converts them into sound, so that their message can be heard. These waves, when set in motion are carried along by electrons—the invisible source of all energy.

We may think of energy as a swarm of living electrons, dwelling in a well; and then picture a



THE PRINCIPLE OF RADIO TRANSMISSION

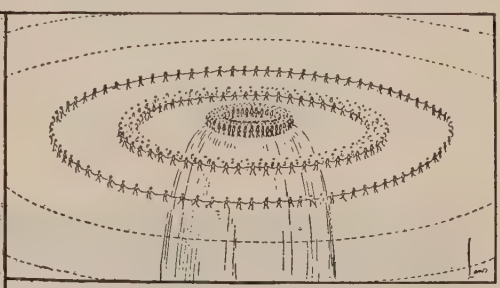
pump dipping into this well, feeding a fountain close at hand. The well represents the source of electricity; the pump, the valve transmitter; while the fountain, of course, the aerial. When the pump is set going the electrons are sucked from the well, and forced through the fountain nozzle in a series of charges, or jerky jets, which eventually stream back into the well. But during this rapid up and down flight it is obvious that there must be a momentary lull between the jet reaching a zenith and its change into a downward stream; infinitesimally short as this period may be, the electrons are so brimful of energy that some, hovering in the crown of the jet, are flicked off into space. Holding each other's hands, and rejoicing in their freedom, the tiny creatures now move swiftly away in an ever widening ring of radiant energy, thus creating sound waves.

With the next stroke of the pump another charge is sent upwards, and another ring of electrons starts forth on its ever-widening journey into space. As long as the fountain—the broadcasting station—continues to send up jets there will be a perfectly regular series of migrating electron rings or bands, one within the other, with a constant distance between them depending purely on the number of charges sent up each second. This distance we call the *wave length*, meaning a natural disturbance in the ether, set up by the moving bands. The number of bands sent out each second is known as the *frequency*, a quantity which varies with the speed of the pump.

Our picture of radiation is now almost complete; in fact, there is only one more detail to describe. As the waves travel outward they become attenuated, in other words, the front presented by the moving electrons becomes less dense. Hence the farther away a receiving aerial is the fewer will be the number of electrons attracted toward it from the passing waves. But this brings us to our second subject—*reception.*

The ever-spreading waves encounter a number of receiving aerials, and around each one a little swarm of electrons cluster, detaching themselves from the rest who, without pausing in their flight, instantly close ranks. The little swarm, then circle down the aerial, but ere reaching this desired haven are conducted through a receiving trap; this is nothing more than a well-oiled and delicately balanced pump working in a reversed sense—the receiver. Instead of the pump working on the electrons, these latter now yield up some of their energy to the pump, impinging on it at regular and highly rhythmic intervals, and jerking it into action.

The pump can be so adjusted that when waves of one particular frequency pass the aerial, it will



ENLARGED VIEW OF CROWN OF JET

respond most readily, pumping energy through the telephones and causing them to sing in unison —either with musical dots and dashes, or in more or less musical speech. For waves of any other frequency the pump will be sluggish, or even inert.

A radio "wave" sent out by a broadcasting station is not a single wave merely; it is a continual succession of waves, one after the other like waves on the ocean. The wave length is the distance of these waves from each other as they follow along through the ether.

There is good reason to believe that waves move with the speed of light, which is approximately 186,326 miles a second. Experiments have proved that the speed of radio is at least close to this, if not exactly equal to it.

The necessary parts of a radio transmitting set are, first, usually a vacuum tube, that produces the carrier wave; next there is the microphone, a form of telephone transmitter that picks up the sound waves and converts them into electric vibrations; next the modulating system, an assemblage of vacuum tubes and other apparatus that superposes the audio-frequency electric vibration from the microphone on the carrier wave. Finally there is the antenna from which the combined or "modulated" wave is radiated into space.

The essential parts of a radio receiving set are, first, the antenna, which is a wire raised in the air or some other device to pick up the radio waves out of the ether; next, the ground, which is merely some electrical connection with the earth. The waves picked up by the antenna pass off into the earth through the ground. Third is the detector, which is a device (usually a crystal or a vacuum tube) the purpose of which is to take off the message that the radio wave carries. Finally, there is the telephone or loudspeaker, which is a device for converting the electrical signals in the radio set into sounds that you can hear. Many radio sets contain other parts besides these four but these are the essentials.

The longest *wave length* now in use is about 20,000 meters, which means that the distance between one wave and the next one is over 12 miles. It is certain that much longer radio waves even than this exist but they have not been put to use or studied by scientists. The shortest waves actually used in

radio so far are about 1.5 meters (4½ feet) long.

The working of a radio set is explained wholly by *electrons* acting through the mechanical devices just described. All substances are composed of electrons, and they, too, are responsible for electric currents. There are a lot of electrons in the copper wire of a radio antenna. When the radio waves come along through space and hit against the antenna they set the electrons in it into vibration, much as a water wave on the surface of a pond will set little floating chips to bobbing up and down. The vibration of the electrons in the antenna wire communicates itself to the electrons in the wires and instruments of the radio receiver. All that happens in a radio set while it is working can be explained by this vibration of the electrons inside the wires and other parts of the set.

Radio sets *receive* only those stations when they are *tuned* to the same wave length of the station sought. This means a good deal the same thing as tuning two violin strings so that they are, as musicians say, in unison. If two strings (on different violins) are thus tuned so that they are exactly alike and if you sound one of the strings, the other will vibrate sympathetically when the sound waves from the first string reach it. Similarly, a tuned radio receiver vibrates sympathetically when radio waves of the right wave length reach it.

When was radio discovered? Observations of what we now know to have been radio effects were made in France by Jean Baptiste Biot in 1819. Biot noticed that a live frog twitched when an electric spark was produced thirty feet away. Professor Dolbear, in America, sent messages by radio in 1882, but he, too, failed to understand the discoveries he had made. The beginning of modern radio is usually dated from the famous experiments of Marconi in 1897 and 1898.

THE SUN'S INFLUENCE ON WIRELESS

Static is the name for the crashes, hisses, clicks, buzzes and other noises that occur naturally in a radio receiver, especially in the summer. It is believed that most of this static, if not all of it, is caused by lightning or other electric discharges in the atmosphere. The sunlight produces in the air a great many tiny particles of matter charged with electricity. These are called "ions" and the air is said to be "ionized." The chief effect of these ions on the radio waves is to absorb some of the energy of the wave. Hence the waves become weaker per mile of distance travelled in the daytime when there are many ions in the air than they do at night when there are few.

an antenna and earth line. The microphone transmitter may be included in a circuit associated with the inductance, in which case the voice acting on the resistance of the transmitter causes variations in the oscillating currents; or it may be associated with some part of the direct-current circuit, in which case it acts by affecting the current passing across the arc.

Any form of receiver may be used with this arc apparatus. The great advantage of this method is that the arc produces continuous oscillations of constant amplitude, and that the wave-length and frequency of the oscillations are subject to better regulation and control.

ADVANTAGES.—The advantages of wireless telephony over wireless telegraphy are many. One is that no skilled operator is required to translate the dot-and-dash signals; for in the latter one hears only long and short buzzes, whereas in the former one hears the actual spoken words. By means of wireless telephony the transmission of intelligence is far more direct and expeditious, and in times of emergency this not unfrequently becomes a very vital question indeed. An important characteristic of wireless telephonic communication is the exceptional clearness of the articulation, owing to the absence of the electrostatic capacity of metallic lines and cables which is always present in wire telephony.

Stronger currents, improved sending and receiving apparatus, and the application of new principles have now greatly extended the speaking range; and only recently distinct communication has been established by wireless telephony between New York and San Francisco. The use of the wireless telephone will be greatly extended, especially in naval, military, and shipping communication.

THE MARVEL OF X-RAYS

Röntgen or X-Rays, the most famous, and up to now by far the most useful, kind of rays associated with high vacuum tubes, were discovered by Professor W. K. Röntgen in 1895. His first observation was that a photographic plate, which was enclosed in an opaque material and which was lying by chance near the apparatus, was affected just as if it had been exposed to ordinary light. This caused him to conclude that the effect must be due to some unknown kind of rays, and the uncertainty as to their character led him to provisionally apply to them the name of X-rays, for x in algebra generally denotes the unknown quantity.

The later sensational part of his discovery was that the property possessed by a highly exhausted bulb of glass, fitted with suitable electrodes, sends out rays or electric discharges capable of passing through many bodies which are quite opaque to ordinary light, and of either affecting a photographic plate or causing a screen coated with certain chemicals to fluoresce or light up under their influence.

How are X-rays produced?

X-rays are thus produced by the discharge of a high-potential current through a special form of vacuum tube, known as a Crookes' tube. The positive terminal of an induction coil or Wimshurst machine is connected to the anode and the negative to the cathode of the tube. The anticathode is connected to the anode and is also positive. The vacuum of a tube is not

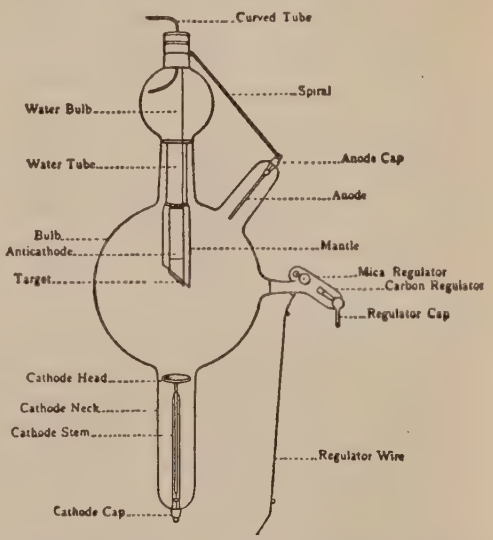

DIAGRAM SHOWING PARTS OF X-RAY TUBE

perfect, and the current is conveyed through the tube by the infinitesimal quantity of air contained therein.

The "cathodal rays" which pass from the cathode to the anticathode consist of infinitesimal particles traveling at a high rate of speed; when the progress of these minute bodies is arrested, X-rays are produced. The green fluorescence on the sides of the tube opposite the anticathode, though not caused by the X-rays, demonstrate their presence.

WHAT THE X-RAYS ARE.—The X-rays are ethereal vibrations traveling with much the same velocity as light. They travel in a straight line in all directions from the point of origin, and are almost incapable of reflection or refraction.

X-rays are invisible to the eye, but have the property of rendering fluorescent certain substances—for example, calcium tungstate and barium platino-cyanide. When a screen coated with these substances is placed near the X-ray tube in a darkened room, the tungstate or barium surface emits a fairly bright fluorescence. If an object such as the hand or a lead pencil is placed between the screen and the tube, the denser parts (the bones or the graphite) appear as black shadows in a gray background.

X-rays penetrate all substances to a greater or less degree, although heavy metals, such as lead and mercury, are, for photographic or visual purposes, practically opaque to the rays.

The greater part of X-ray examination is conducted by photographic methods, as the image given by the rays on a dry plate or film show far more detail than can be seen by visual examination with the fluorescent screen.

APPARATUS.—The apparatus required consists of a suitable source of electrical energy, such as a battery or dynamo, etc., and a powerful induction or a large electrostatic influence machine, combined of course in either case with

an X-ray tube and special X-ray photographic plates. Ordinary photographic plates can be used, but do not give such brilliant results. If we wish to take a radiograph of the hand, we must first of all use a plate slightly larger than the hand, and enclose it in an opaque envelope. Two such are usually employed, one red and the other black. This is placed on the table or stand, film side uppermost, and the hand is placed upon it, and a short distance above the hand is located the X-ray tube. Since what we really take is a shadowgraph picture, to give a good sharp outline, the hand should be placed as flat as possible on the plate, and the tube some six to eight inches from it.

With some of the most powerful apparatus now in use, even the human trunk can be radiographed in a single flash, which is an improvement on the exposure necessary in the early days of its use, when ten, twenty, or even forty minutes' exposure was no uncommon practice.

The Fluorescent Screen.—When the X-rays impinge on certain substances they cause them to light up or "fluoresce" under their action. The number of bodies or chemicals which do so is very large, but for practical purposes only one or two are of any use. The best, and the one always employed, is a chemical known as barium platino-cyanide. The screen-holder consists of a box, preferably of pyramidal form, with a flattened apex or top. Inserted in this apex are two tubes, like opera-glass tubes but without lenses; through these we can look into the box in such a manner as to prevent any outside light from entering. The bottom of the box consists of the screen proper, a piece of cardboard or other suitable substance, one side (the inner) of which is coated with the substance mentioned above, because the light rays given off by the barium platino-cyanide under the action of the X-rays cannot of course penetrate an object opaque to light. The box should be absolutely light-tight except for the eye-tubes.

If such a screen be held in the neighborhood of an X-ray tube, opposite the most brilliantly phosphorescing half of the tube, it will be found to be lighted up under the action of the X-rays. If now we place between the tube and the screen an object such as the hand, putting it in as close proximity to the tube as possible, we obtain a shadowgram on the screen, varying in intensity according to the relative transparency of the different parts of the hand to the X-rays. Since the bones are far less transparent than the flesh, they cast a much denser shadow and are very distinct. On such a screen it is possible to see the beats of the heart, the rising and falling of the diaphragm, etc.

X-rays at Work.—In medical X-ray work, the patient is placed upon a couch consisting of a wooden frame covered with canvas. A box containing the tube moves on wheels and rails beneath the couch; it is lined with metal to shield the operator from the X-rays. The time of exposure depends upon the strength of current used, the power of the coil, and the condition of the tube. A "hard" tube—that is, a tube with an extremely high vacuum—requires less exposure than a "soft" or low-vacuum tube.

The condition of the tube is ascertained by finding its "equivalent spark gap." While the coil and tube are working, the terminal points of the induction coil are slowly brought together. If a spark passes between the points while they are six inches or more apart, the vacuum is too high. If no sparking takes place between the terminals till they are within three inches of each other, the tube is low. A good working spark gap distance is four and one-half inches. A soft, or low-vacuum, tube gives better definition than a hard, or high-vacuum, tube, as the rays pass less easily through dense substances and show greater differentiation of tissue. A very high vacuum tube may show but little difference between the bones and flesh, while a soft tube should give the minute structure of the bones.

Time of Exposure.—With a current of five amperes at one hundred volts passing through the primary winding of a ten-inch coil, the exposure for a hand or foot would be from three to fifteen seconds. The exposure for the thicker portions of the body would be from twenty seconds to two minutes. If an electrolytic break is used, about half the exposure would be required. Dry plates with extra thick sensitive films are specially prepared for radiography, the development and fixation being the same as in ordinary photography. The image is sometimes barely visible on the surface of the plate during development, but when fixed the negative may give good density and definition owing to the penetration into the film of the X-rays.

Kinds of X-rays.—It is now known that these rays are not all by any means of the same kind or of the same penetrative power. Moreover, these differences can be still augmented by altering what is known as the induction in the circuit, the degree of exhaustion in the tube, and the nature of the emitting surface. The emitting surface is not the glass walls of the tube, as many suppose; and the canary colored light emitted by the tube is not the X-rays, which are themselves invisible. They originate from the anode of the tube owing to the fierce bombardment to which the cathode rays subject it. Where the cathode rays, which travel in straight lines, first strike any material object, from that same object the X-rays originate.

Uses of X-rays.—In the early days of radiography the X-rays in medical work were confined almost solely to the detection of fractured or injured bones, and abnormal bone growth. At the present time, however, even a careful examination on the fluorescent screen is sufficient to enable an expert medical radiographist to diagnose with a considerable degree of exactitude the condition of the heart, the lungs, and the stomach. In making such examination a tube must be chosen which has the lowest vacuum, in order to obtain the maximum amount of contrast between fleshy tissue not differing greatly in density.

In some cases even the liver has been outlined and part of the kidneys.

Still more important is the fact that the rays have been applied successfully in the treatment of certain diseases which by other means have been deemed, if not incurable, at any rate extremely difficult to cure. Claims have been made for cancer cures by means of these same rays; whether these have really been complete cures or not is perhaps open to question.

X-RAY DERMATITIS.—A painful and incurable disease, of a cancerous nature, to which radiographers are liable, caused by frequent and prolonged exposure to X-rays. Many of the pioneers of radiography have fallen victims to this complaint, but greater precautions are now taken to protect the operators from the X-rays. There is little danger of contracting this disease in X-ray photography, as the exposures are short and the operator need not stand directly in front of the tube. The chief risk is entailed by visual examination with the fluorescent screen. The disease first makes its appearance in the hands and gradually spreads to the arms and body. The skin at first appears as if it had been burned, hence the term "X-ray burning."

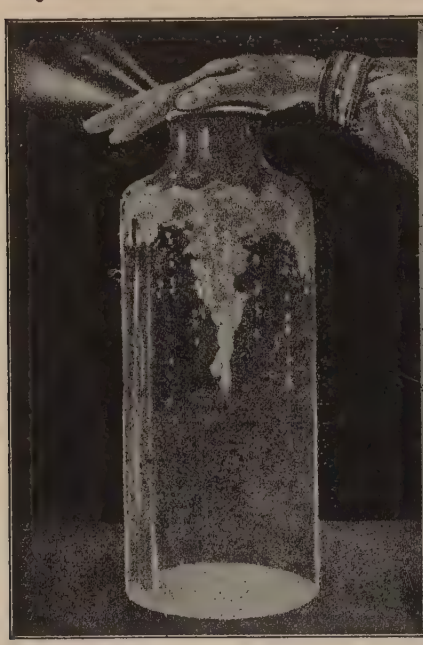
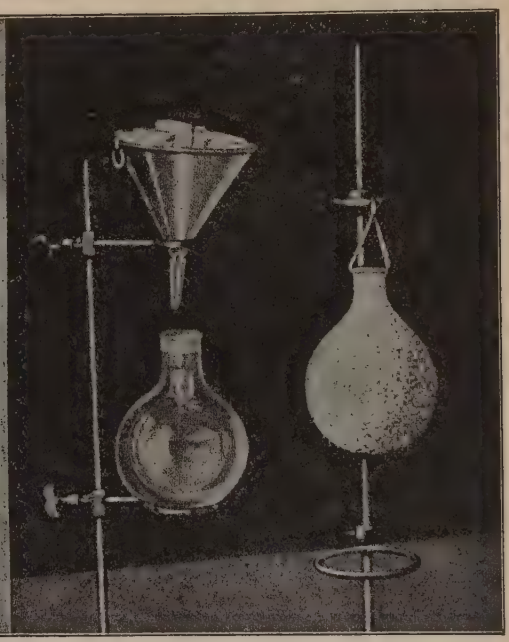
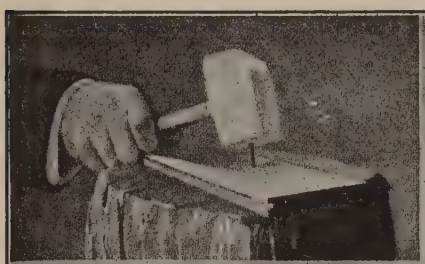
LIQUID AIR AND ITS MARVELS OF LOW TEMPERATURE



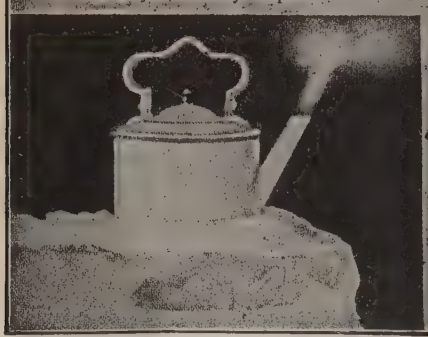
Liquid Air in water. The silvery bubbles are liquid oxygen; the nitrogen boils away.



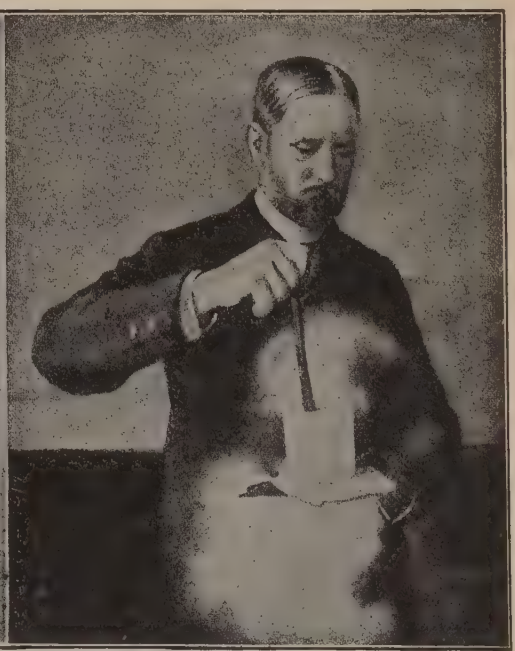
Filtered Liquid Air in a Dewar bulb, and Liquid Air in an ordinary glass bulb (which has collected a coating of frost).



Driving a nail with a hammer made of mercury frozen by Liquid Air



Liquid Air boiling on a block of ice, caused by the difference of temperature.



Burning steel in an ice tumbler partly filled with Liquid Air.

Liquid Air is simply its gaseous form brought into liquid condition by the combined effect of lowering its temperature and subjecting it to an extreme expansion. When protected from external heat and highly exhausted it becomes a transparent, jelly-like, mass. By means of liquid hydrogen it may be condensed into a white solid with a faint blue tint.

BOOK OF THE HUMAN BODY

WHAT THE HUMAN BODY IS

ITS DIVISIONS AND SYSTEMS

GENERAL STRUCTURE OF THE BODY

FRAMEWORK: Bones, Muscles and Cells

THE DIGESTIVE SYSTEM AND ORGANS

CIRCULATION OF THE BLOOD AND RESPIRATION: Heart, Blood Vessels, Lymphatics, Lungs and Bronchii

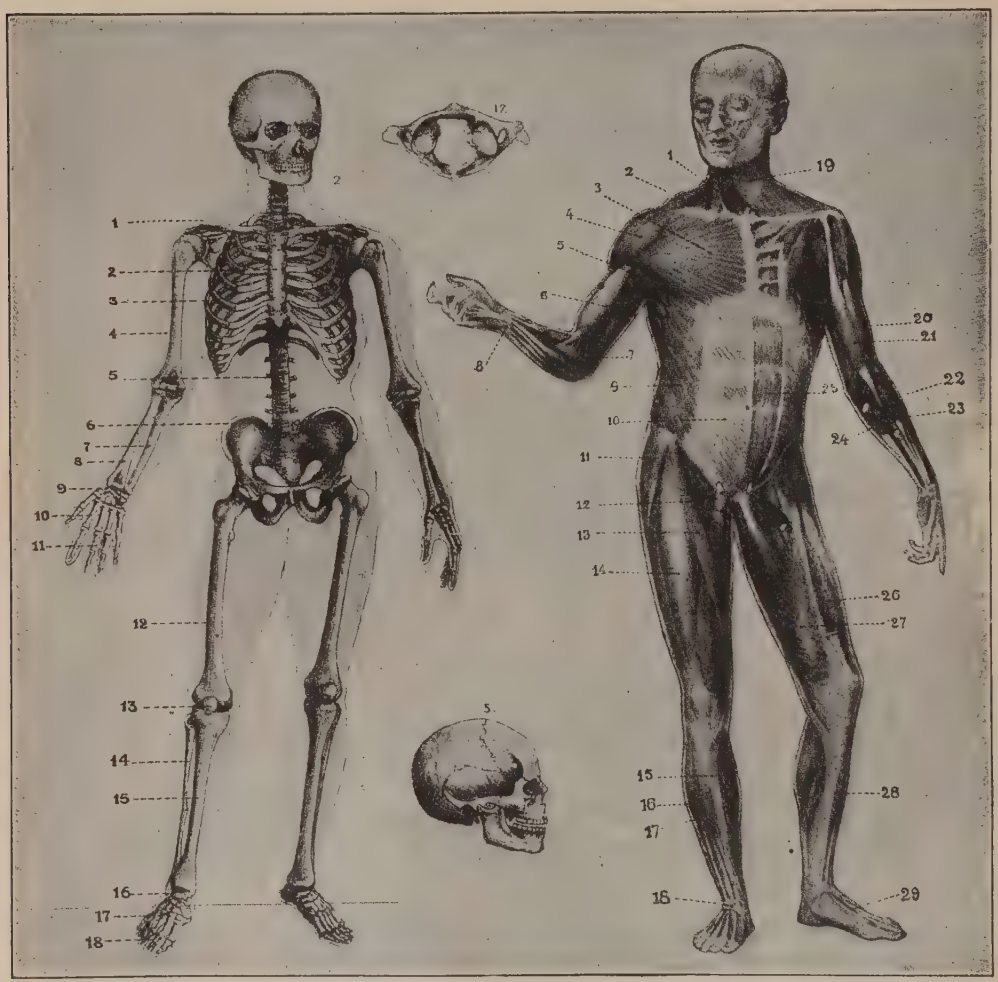
THE EXCRETORY SYSTEM: Intestinal Tract, Kidneys, Sweat Glands, Lungs

THE NERVOUS SYSTEM: Nerves, Brain, Spinal Cord

ORGANS OF SPECIAL SENSE: Eye, Ear, Nose, Tongue, Hand and Skin

CHARTS, TABLES AND SPECIAL FEATURES

THE FRAMEWORK AND MUSCLES OF THE HUMAN BODY



PRINCIPAL BONES OF THE BODY

1. Collar Bone. (Clavicle)
2. Breast Bone. (Sternum)
3. Ribs.
4. Arm Bone. (Humerus)
5. Lumbar Vertebra.
6. Haunch Bone. (Pelvis)
7. Ulna.
8. Radius.
9. Wrist. (Carpus)
10. Metacarpus.
11. Phalanges.
12. Thigh Bone. (Femur)
13. Knee Cap. (Patella)
14. Brooch Bone. (Fibula)
15. Shin Bone. (Tibia)
16. Tarsus.
17. Metatarsus.
18. Phalanges.

PRINCIPAL MUSCLES OF THE BODY

1. Sternoclidomastoid (the muscle that bends the head).
2. Trapezius.
3. Pectoralis (chest muscle).
4. Deltoid (arm lifting muscle).
5. Coraco brachialis (rudimentary arm muscle).
6. Triceps (forearm extension).
7. Pronator radii teres (turns forearm and hand).
8. Annular ligament of wrist.
9. External oblique of abdomen.
10. Muscular sheath of abdominal erectus muscle.
11. Tensor fasciæ latæ (fibrous muscle covering thigh muscles).
12. Gluteus (controls thigh and helps to keep body erect).
13. Sartorius, or tailor, muscle (enables legs to be crossed).
14. One of quadriceps extensor cruris muscles.
15. Gastrocnemius (bends the knee).
16. Long extensor of toes.
17. Peroneus longus (helps to keep foot arched).
18. Annular ligament of ankle.
19. Platysma.
20. Brachialis (moves elbow joint).
21. Biceps (flexor of arm).
22. Supinator longus (turns hand).
23. Extensor carpi radialis (extensor of forearm and wrist).
24. Flexor carpi radialis (bends wrist and turns hand).
25. Rectus abdominis (retracts abdominal wall).
26 and 27. Vastus externus and internus. These, with 14 and an abductor muscle, together make up the quadriceps extensor, the largest muscle in the body. It extends the leg.
28. Tibialis (extends the ankle).
29. Extensors of the toes.

The bones which make up the framework of the body are held together by joints of different kinds which allow of widely varying ranges of motion. The skull, which contains twenty-two bones in all, includes the cranium which contains the brain, and the bones which form the framework of the face. The vertebral column, which acts as a hinged and pliable tube down the center of which runs the spinal cord, is made up of twenty-four true vertebræ and the sacrum and the coccyx. The thorax, the bony box or cage protecting the heart and lungs, is made up of the twelve dorsal vertebræ with the twelve ribs on each side and the sternum or breast bone in front. The upper extremities consist of the shoulder-blade or scapula, the collar-bone or clavicle, the humerus or upper arm bone, the two fore-arm bones (radius and ulna), and the twenty-seven bones of the hand and wrist. The pelvis is composed of the two hip bones, together with the sacrum and coccyx The female pelvis is larger in all diameters than the male. The bones of the lower extremity, which is joined to the pelvis by the head of the thigh bone (the femur), making a ball and socket joint at the acetabulum, are the two bones of the leg, the tibia and fibula; the patella or knee-cap; and the twenty-six bones of the ankle and foot.

BOOK OF THE HUMAN BODY

The study of the Human Body involves numerous other branches of science, and, as a whole, is the most complex and intricate of all the sciences. To explain its structure and workings we apply the principles of Biology, Physiology, Chemistry, Physics, Psychology, and Metaphysics.

The individual man, as a whole, is frequently forgotten both in physiology and in medicine, owing to the extraordinary minuteness and exactness with which each part and organ is examined and described. At the outset, then, it should be remembered that the human body is an organic whole, and what makes it *one* is not the similarity or unity of the machines and processes, for they are unlike and many; but it is the unity of the one governing force, the *mind*, and especially the *unconscious mind*, which presides over the body.

Nothing in the body is merely mechanical, although there is much mechanism; all is vital, all is united in one great aim—the health and well-being of the individual.

All organs and systems are held together and formed into one body by means of a framework, partly fixed and partly movable, partly rigid and partly flexible, partly hard and partly soft.

The *skeleton* part of the framework is made of *bone;* flexibility is given to certain parts by means of joints, which are simply smoothed and rounded ends of bone covered with gristle to avoid friction, and joined together by fiber and ligament for strength. This forms the rigid and hard parts of the framework.

The flexible and soft part, which everywhere covers organs and muscles, is composed of a layer of fat to preserve the warmth, as fat is a non-conductor, and an outer covering of skin.

This framework is exquisitely adapted to give strong protection to the vital parts so that they cannot readily be injured; and the whole of the organs are so arranged and stowed away that a perfect human body is a beautiful object full of symmetry and graceful curves and lines.

Divisions of the Body.—If we divide the body into six parts—four limbs, trunk, and head and neck—we find each part contains about thirty bones (counting the ribs in pairs) there being about *two hundred* in the entire body.

The height of the body depends mainly on the length of the bones of the lower limbs.

Everything in Pairs.—In the body almost everything is paired, right and left, giving it symmetry. There are but five central bones: two in the head, one in the throat, and the breastbone and backbone (or spine); and there are but five single muscles, all the rest—out of many hundreds—being in pairs. In the interior, where economy rather than symmetry is required, it is not so; there being as many single organs as there are double.

The Body Viewed as a Machine.—A favorite way of looking at the body as a whole is to regard it as an anatomical machine. In this view the body has an internal skeleton, of which the chief feature is the central axis or backbone.

Considering the skull and backbone as one, the body may be said to be built up of two tubes. The smaller posterior or neural tube includes the cavity of the skull and the vertebral canal. Within this tube is lodged the nervous center, or engine, of the body. The anterior, or body, tube is much larger, consisting of the face above, and the neck and trunk below, and it contains the *four nutritive systems* of life, so that the whole body in section is like an eight with the lower circle immensely exaggerated. The limbs, of course, are not tubular, and merely form part of the machinery.

Adopting the simile of the human engine and boiler and machinery, we see that the limbs, etc., are the machinery; the posterior tube the engines and force that move them; and the anterior tube the human boiler that generates the force. This boiler, like one in a steam engine, has an upper and lower part. The upper part is where the steam is generated (in lungs) and sent to the engine (the brain) by the heart. The lower part is where the fuel is burned (the stomach) and the ashes and refuse drop through (the intestines). So that the analogy between the two is close and striking.

Centers of Control.—There are two distinct seats of government in the human body: the one in the *upper brain*, or cortex, the other principally in the very center of the human body. That in the upper brain, or cortex, is the human will and the conscious mind. It has absolute control given to it over the animal part of the human life—that is, over the part that consists in the using of force, which includes the nervous and locomotor systems, and the special senses.

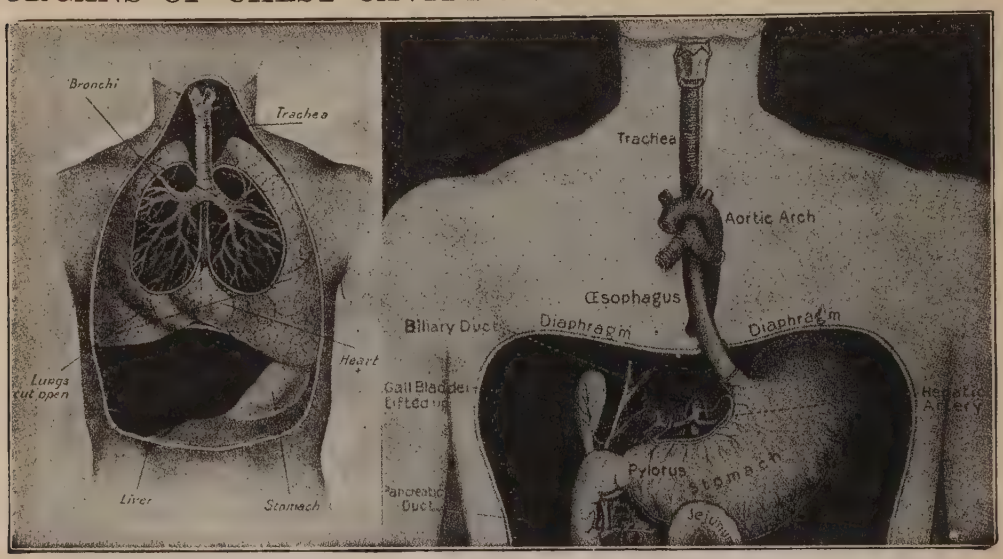
Nutritive Systems.—The other government, situated in the lower part of the brain and spinal cord and in the center of the body—in front of the spine and behind the stomach—is of an entirely different order. To put this more plainly: The four systems that lie in the body—*digestive, circulatory, respiratory,* and *excretory*—may be termed the nutritive systems, being designed for the maintenance and storage of life-forces. They are almost entirely under the control of the involuntary nerve centers, and have full and undisputed sway over life itself—that is, over the generating and storing of vital force, rather than over its usage.

SYSTEMS AND ORGANS OF THE BODY

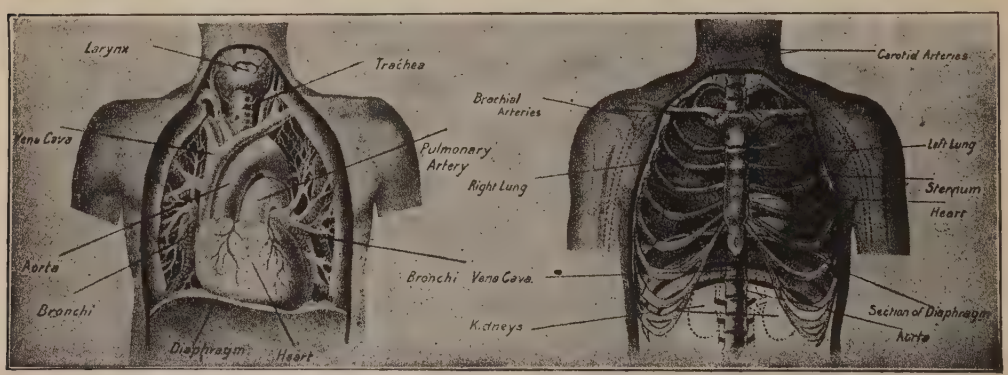
How the Body is Built.—In a building such as the body it is well to begin with the *unit*—the building unit. In a house this is a brick or a stone; in all living structures, animal and vegetable, it is a *cell.*

All living structures, whether animal or vegetable, are built up of cells (which we shall consider in due course), and these cells are grouped together for different purposes to form different tissues. The *tissues* are the different materials of which the body is made. There are eight principal tissues in the body: *bone, gristle, muscle, nerve, skin, fat, fiber,* and *connecting* tissue.

ORGANS OF CHEST CAVITY IN RELATION TO STOMACH



THE BRONCHIAL TUBES ORGANS INVOLVED IN FIRST STAGES OF DIGESTION



DIAGRAMS DISCLOSING HEART AND CONNECTIONS, RIBS AND LUNGS

(1) The *Osseous*, or bone tissue, is the framework of the body. This material is found, of course, in every part of the body and forms the skeleton.

(2) The *Cartilaginous*, or gristle, forms the joints of the body. This tissue covers the ends of the bones to form the joints; it unites the ribs with the breastbone; it forms the rings of the windpipe and the lid of the larynx at the back of the tongue; the lower part of the nose, the upper eyelid, and the ear.

(3) The *Muscular*, or muscle, forms the machinery of the body. This tissue covers all the bones with flesh, which is muscle, and is the chief part of a number of machines by which every movement is performed. It is also an important tissue in the wall of the abdomen and the floor of the chest.

(4) The *Nervous*, or nerve tissue, is the moving power of the body. It is the chief constituent of the brain and the spinal cord, inside the backbone or spine. It also forms the nerves, which run like white threads from the brain to all the muscles, and give them power to move.

(5) The *Epithelial*, or skin, forms the outer covering of the body. This tissue is the skin that covers the body outside, and lines it as mucous membrane inside, and also forms the teeth and nails.

(6) The *Adipose*, or fat, forms the under covering of the body. This tissue is the inner protective sheathing and padding of the body, beneath the skin, and round the internal organs. It consists of drops of oil, enclosed in separate cells.

(7) The *Fibrous*, or fiber or sinew, is the tissue that forms the cords and bands of the body. This tissue makes the strong tendons that fasten the muscles to the bones, and forms the covering or sheath of the bone itself, and the various organs.

(8) The *Connective*, or cementing tissue, joins all the parts and cells of the body together. This substance is found everywhere, all over the body, and is like the mortar in a house, fastening all the bricks together. It is a sort of network of cells and long fibers.

Special Systems.—These eight tissues are combined together into various groups of *organs* or *systems* for special purposes. These groups are *six* in number, and include: the *circulatory, respiratory, digestive, excretory or secretory, locomotor,* and *nervous systems.* There is also the *reproductive* system, which has to do with the propagation of the race, and involves many important and vital questions.

We may divide these six into three groups:

There are two in the chest:

(1) The *Circulatory* system is that by which the blood or liquid food is distributed throughout the body to all the tiny cells. This system includes the *heart* or force-pump, and the *arteries*, *capillaries*, and *veins* or the three kinds of pipes through which the blood travels.

(2) The *Respiratory* system is that by which we breathe, and by which the body is fed with oxygen, which gives the blood its bright red color. This system includes the nostrils and mouth, the windpipe and the lungs.

Then there are two in the abdomen, or stomach:

(3) The *Digestive* system, by which all the food is made into liquid and changed so as to nourish the body and pass into the blood. This system includes the mouth, gullet, stomach, liver, pancreas, intestines, and other organs.

(4) The *Secretory*, or excretory, system (for they are best grouped as one) manufactures the various fluids of the body, such as bile, urine, sweat, saliva, gastric juice, etc. It consists of various glands or secretory organs in different parts of the body, such as those in the skin, the kidneys, the lymphatic glands, the spleen, etc. It also gets rid of the refuse of the body.

Lastly, there are two in the head and limbs:

(5) The *Locomotor* system, by which all movement is effected. This includes the bones, joints, and muscles.

(6) The *Nervous* system, by which all the body is controlled, directed, and regulated. This system includes the brain, spinal cord, and the special senses, such as the ear, the eye, and all the nerves.

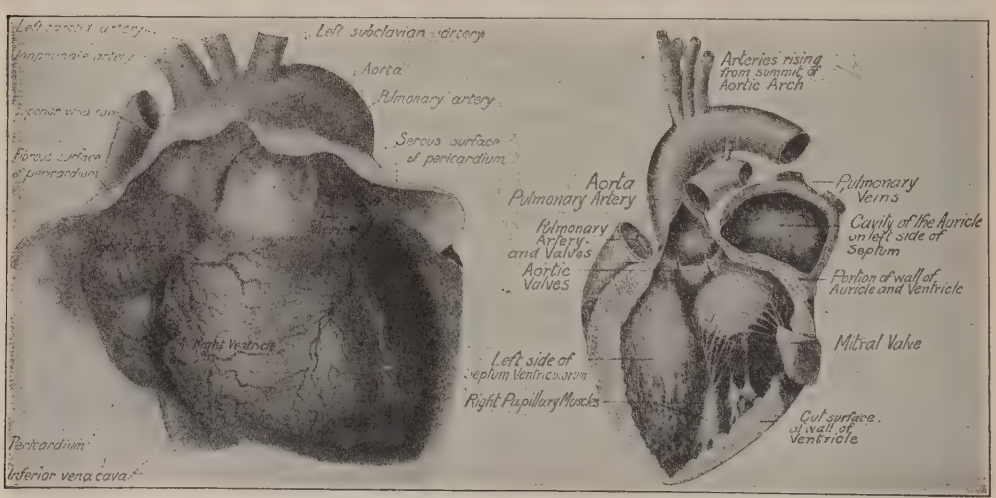
The Human Chest, or Thorax.—In it, the blood is purified and circulated. The *thorax* is closed above and below: above, by the neck, through which the windpipe enters it in front, conveying air to the lungs; and by the *gullet* behind, conveying food to the stomach. Below, the floor, dividing it from the abdomen beneath, is formed by a very large muscle stretching right across the body, called the *Diaphragm*, or partition wall; also called the *Midriff*. The thorax is walled in at the sides by the ribs, and behind by the backbone in which is the other tube that contains the spinal cord. The thorax contains the two organs of *respiration* and *circulation*.

The *lungs* are the organs of respiration. They are like two sponges filling the right and left halves of the chest. Wherever you can feel a rib there is part of the lung underneath. Each of these lungs is contained in a bag, like a skin, that separates it from the ribs, and is called the *pleura* (from *pleuron* = *a rib*), but the lung is not *inside* the bag.

The *outer* layer of the pleura is fixed to the side of the chest, the *inner* layer to the lung, and the two layers move on each other like a joint when we breathe.

The lungs are full of small air-cells with minute tubes leading from them. These gradually increase in size as they join together, till at last they unit in one large tube, or bronchus, for each lung. These two bronchi join together, and form the *windpipe*, or *trachea*, which conveys the air through the larynx into the mouth.

The windpipe is kept stretched widely open by a series of elastic rings of gristle. Behind the windpipe is the gullet, leading to the stomach.

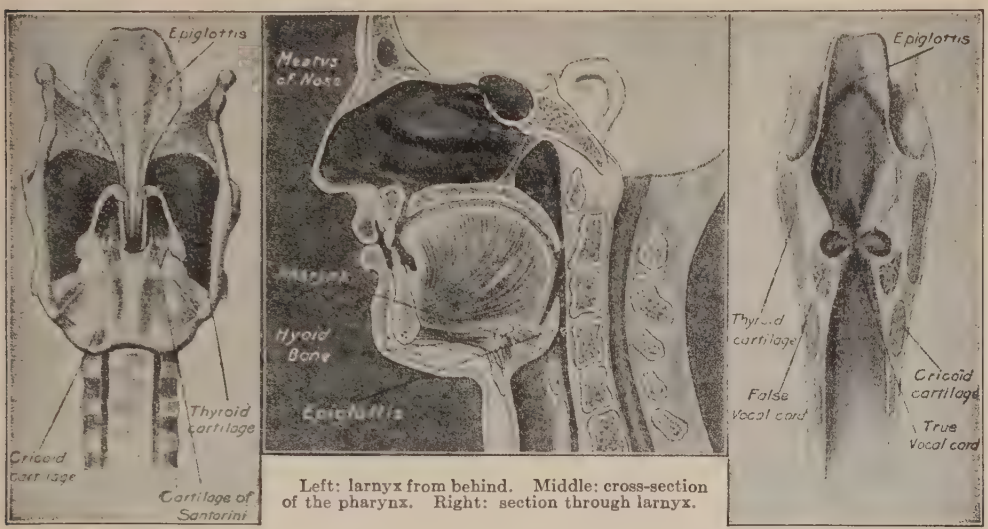


PERICARDIUM OF THE HEART **LEFT AURICLE AND LEFT VENTRICLE**

The heart, the main pump of the circulatory system, rests on the diaphragm between the two lungs. The heart is enclosed in a smooth, moist membrane or sac, the pericardium, which allows it to dilate and contract without friction against the adjoining parts. There are four cavities in the heart, the right and left auricle, and the right and left ventricle. The auricles, which are thinner walled, collect blood from the veins, while the thicker and stronger walled ventricles force the blood into the arteries. The left auricle pumps the purified blood into the left ventricle, the valve between the auricle and ventricle opening to allow this passage. When the left ventricle is full the valve between its chamber and that of the auricle closes, the ventricle itself contracts down, and the blood is pumped out through the aorta to supply all the tissues of the body.

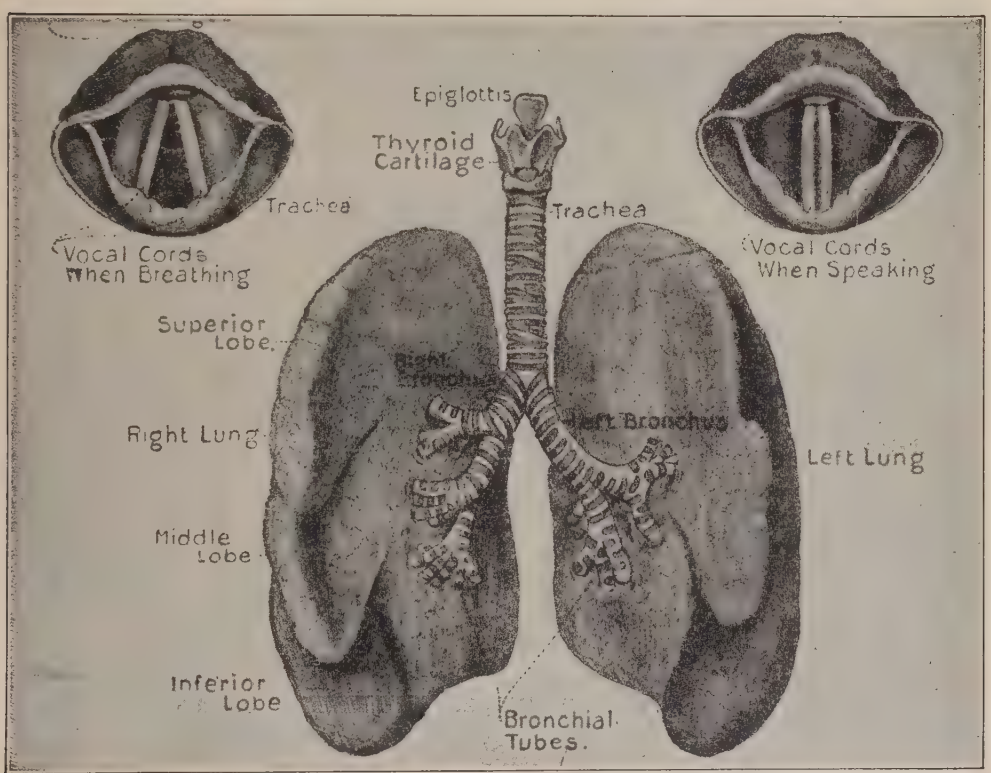
After leaving the left ventricle through the aorta the purified blood is carried to the head, arms, trunk, and lower limbs, etc. Finally, after being deprived of its oxygen as it passes through the tiny end-arteries, or capillaries, of the tissues it has to nourish, it is collected in the veins and is emptied into the right auricle. Passing from the right auricle to the right ventricle, this impure blood, which is of a dull purplish color, is pumped into the lungs, where it is deprived of its waste gases and once more takes up a fresh supply of oxygen. Bright scarlet in color again, it now is collected and carried to the left auricle by the pulmonary veins. From the auricle it passes through the mitral valve to the left ventricle, whence it is once more pumped out through the aorta to supply the tissues.

RESPIRATORY SYSTEM OR AIR PASSAGES OF THE BODY

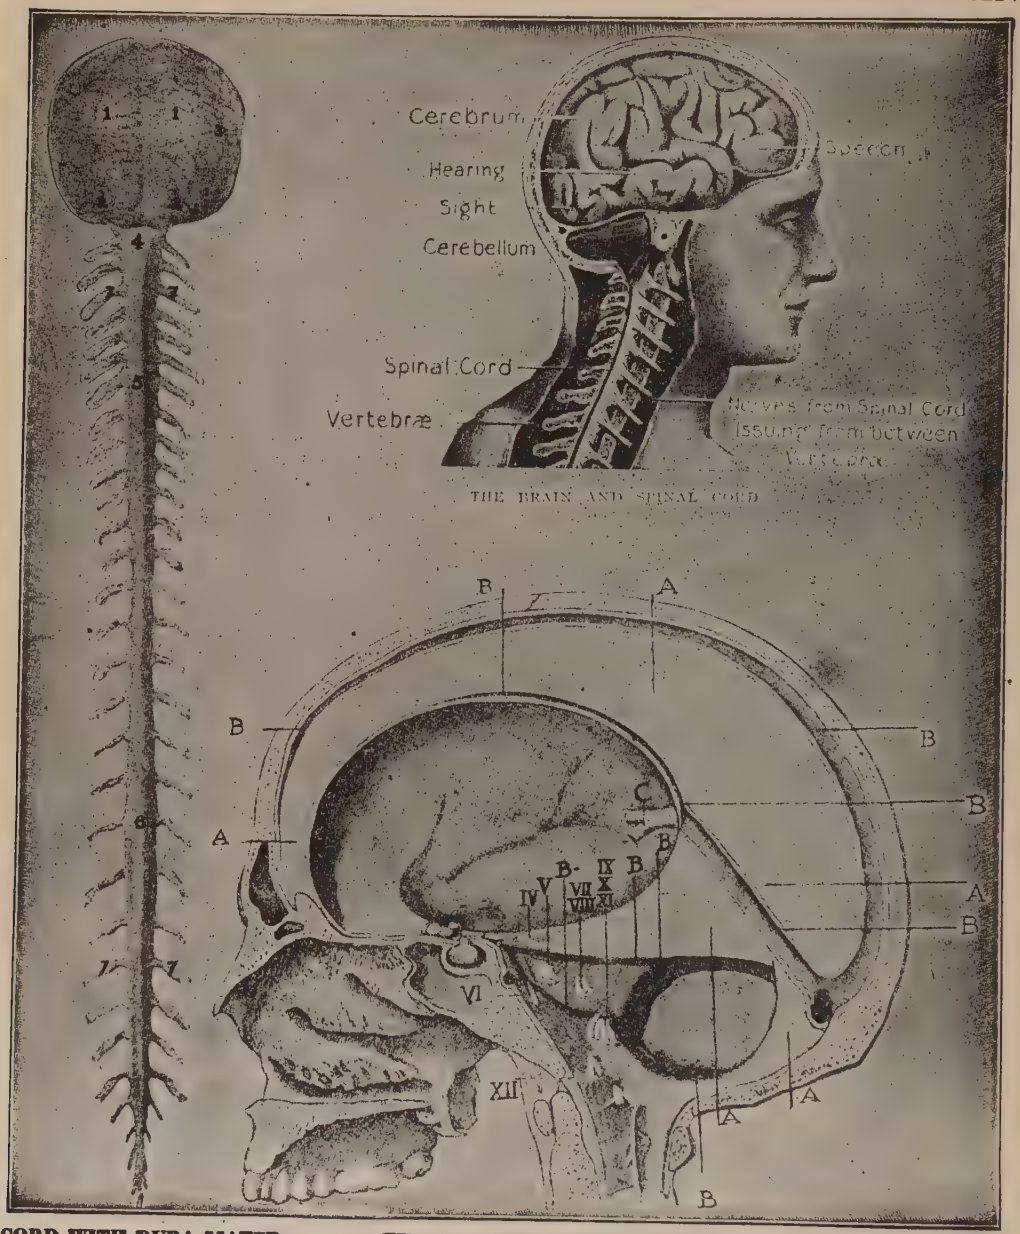


Left: larnyx from behind. Middle: cross-section of the pharynx. Right: section through larnyx.

VIEWS OF THE LARYNX, SHOWING HOW THE AIR REACHES THE LUNGS



The organs of respiration are the nose, throat, larynx, windpipe or trachea, and the two lungs. On the outer walls of the nasal cavities are three shelves known as the turbinated bones, the surfaces of which contain blood-vessels to heat the air as it passes through the nose. The mucus which constantly forms on the lining membrane of the nose and the little hairs in the nostrils, act as screens, preventing dust being breathed into the lungs. The pharynx is the cavity behind the nose, mouth and larnyx. The larynx forms a prominence in the throat known as the "Adam's Apple." It contains the vocal cords, the vibrations of which, as air from the lungs passes through them, give rise to voice sounds. The epiglottis is a cartilaginous curtain above the larynx which blocks up its entrance when food is being swallowed. The trachea or windpipe is a continuation of the larynx. Shortly after entering the chest it divides into two main branches, the right and left branches, which lead to all parts of the lungs. The lungs, two spongy, air-filled organs, take up most of the space in the chest-box or thorax. The smallest end-branches of the bronchial tubes open into numerous tiny sacs known as the air vesicles, in the walls of which the end-branches of the capillaries ramify. Here the impure gases in the blood escape through the vessel walls into the air vesicles, while the oxygen breathed into the lungs is taken up the same way by the blood in the vessels.



CORD WITH DURA MATER **THE ARRANGEMENT OF THE DURA MATER**

The nervous system consists of (1) the brain; (2) the spinal cord; (3) the nerves which run off from these structures; and (4) the sympathetic system. The chief mass of the brain is known as the cerebrum, or fore-brain, the small mass at the lower part being termed the cerebellum, or little brain. From the brain, which is contained within the bony skull, twelve pairs of cranial nerves proceed. The most important of these are the first or nerve of smell, the second (sight), eighth (hearing), and twelfth (taste). The fifth, one of the most important nerves of sensation, has three main branches running to the orbit and forehead, the jaws and teeth, and the skin of the face. Six of the twelve pairs of cranial nerves govern the movements of different parts (motor nerves), others have to do with the special sense organs, taste, smell, hearing, and sight (sensory nerves), and others are a combination of motor and sensory nerves. The spinal cord is a continuation of the brain, and is contained in the hollow canal running through the vertebræ of the spine. From it thirty-one pairs of nerves originate. The nerves which run to the arm are collected in a network called the brachial plexus. In the same way the great nerves to the leg come together in the lumbar plexus. The sympathetic nervous system consists of a main nerve trunk running downward along the spine from the skull to the coccyx. This sympathetic system communicates indirectly with the brain and spinal cord, and also with all the great arteries and other important structures in the abdomen.

The dura mater is the strong external cranial membrane which adheres to the skull and also penetrates into the cavities of the brain, dividing it into partially separate compartments. These dividing portions of the dura mater may be seen at A, A, in the diagram above. B marks the various venous blood sinuses of the brain, which receive blood from veins in the different parts of the brain, and, merging into one large sinus (seen at lower right of diagram), afterwards become the jugular vein. C is the great cerebral vein. The Roman numerals mark the great cranial nerves.

We take air into the lungs to pass thence into the blood, and thus be carried to all the cells of the body to enable them to live and breathe.

The Heart.—The *heart* is at the lower part of the chest, between the two lungs. It is a *fleshy* or muscular organ, about the size of the fist—flat above, and pointed below like a sugar-loaf. It lies in a slanting direction behind the breastbone—the broad part, or the *base*, of the heart being upwards and partly to the *right* of the breast-bone; the point, or apex of the heart, being downwards and to the *left*, where it can often be seen beating against the chestwall.

The heart is hollow, and acts like a pump, forcing the blood all over the body through the great vessel that leaves the heart at the upper part. The heart, like the lungs, is enclosed in a double layer of folded bag, called the *pericardium*, because it is round the heart.

The *gullet* runs right down the back of the thorax, and passes out through the diaphragm, which forms the floor, into the abdomen.

The *abdomen* forms the lower half of the trunk, and is often called the *stomach*. It is full of organs belonging to the *digestive system* and *secretory system*, by which the fuel or food is rendered fit for use in the blood and the body.

The *walls* of the abdomen are not protected by ribs like the thorax, but are all formed of flesh or muscle. The principal organs they contain are the *stomach*, the *liver*, the *pancreas*, or *sweetbread*, the *spleen* or *milt*, the *kidneys*, the *intestines*, and the *bladder*.

The Human Brain.—The *head* and *spine* contain the principal nervous systems of the body and four organs of special sense—*sight*, *hearing*, *smelling*, and *tasting*.

The *brain*, which fills the head, consists of two parts: the *Cerebrum*, or greater brain, and the *Cerebellum*, or lesser brain, placed behind and below the larger one. From this brain, nerves run to every muscle of the body, enabling them to move the limbs and body as the mind directs; and another set of nerves run from every part of the body and skin to the brain, enabling the mind to know and feel all that goes on.

The brain is connected with the spinal cord by a flat band of brain matter, that lies on the inside of the occipital bone, called the *Medulla Oblongata*, or the Oblong Marrow. The *spinal cord* runs through a large hole in the occipital bone and right down the open tube formed by the spinal vertebræ, to the bottom of the backbone, and, all along its course, nerves leave it and enter it, as in the brain.

The *organ of sight* consists of the *two eyes*, which receive every image that we see, and transmit it to the brain. The *organ of hearing* consists of the *two ears*, by which we receive all the waves of sound that we hear, and transmit them to the brain. The *organ of smell* is in the upper part of the *nose;* the *organ of taste* at the hinder part of the *tongue*.

The *organ of the voice* is contained in the *larynx* in the neck, which joins the head to the body. Just under the chin in front of the neck you can feel what is called the *Adam's Apple*, which is the front of the larynx, or voice-box, by which the air coming out of the lungs is formed into sounds.

The *sounds* are formed into words by the *mouth*, *tongue*, and *teeth*.

Lower Jaw: 1, 2, incisors; 3, canine; 4, 5, premolars; 6, 7, 8, molars.

THE FIVE GATEWAYS OF KNOWLEDGE

These gateways—which we otherwise name the Organs of the Senses, and call in our mother speech, the Eye, the Ear, the Nose, the Mouth, and the Skin—are instruments by which we *see*, and *hear*, and *smell*, and *taste*, and *touch:* at once loop-holes through which the soul gazes out upon the world, and the world gazes in upon the soul.

THE EAR: THE MARVELOUS ORGAN OF HEARING

The ear is divided into three parts:

(1) The external ear, made up of the outer portion and passage-way which leads up to the drum.

(2) The middle ear or drum, the continuation of the ear passage internal to the drum membrane, and

(3) The internal ear containing the labyrinth and the nerve of hearing.

DESCRIPTION OF THE EXTERNAL EAR

The outermost part, the skin-covered *auricle*, contains no bone, being simply a mass of cartilage covered by skin. It

This diagram shows the marvelous structure of the ear, and how sound reaches the brain. There is marked similarity between the ear and a telephone receiver by which we are able to receive messages from the outside world. Hearing is simply the result of sound-waves striking the drum of the ear which set in vibration the bones of the middle ear, and they in turn vibrate the drum of the inner ear. This sets in motion a fluid, and the wave motions are conveyed along the spiral staircase to the wires, or nerves of hearing, and from there to the telephone exchange, or brain.

acts as a sound catcher and improves the hearing by directing sound-waves into the opening or external *meatus*. This meatus or passage-way runs directly inward for an inch and a half. The inner half of the passage-way runs through solid bone, ending abruptly at the membrane or sounding-board of the ear.

DESCRIPTION OF THE MIDDLE EAR

This part begins at the inner surface of the membrane, and extends inward for about a quarter of an inch. The outer surface of the membrane can be seen by the observer on pulling the top of the auricle or fleshy part of the ear a little upward, so as to straighten out the somewhat curved passageway or meatus. The membrane which is placed transversely across the meatus is whitish-pink or yellowish color.

WHAT THE MIDDLE EAR CONTAINS

The chief contents of the cavity of the middle ear are three tiny bones called the *malleus* or hammer bone, the *incus* or anvil bone, and the *stapes* or stirrup bone. In addition, an important nerve called the *chorda tympani* passes across the middle ear chamber. The three little bones contained in the middle ear may be looked upon as the connecting link between the outer ear, which gathers the sounds, and the internal ear, which transmits the effect of the sound waves to the brain, where they are translated into what we call hearing.

From without inward the three little bones lie touching each other, end to end, the outer end of the first bone being implanted between the layers of the drum membrane and the inner end of the innermost bone, fitting into a tiny opening which connects the middle ear with the internal ear. As the result of their lying touching each other, any movement of the ear drum caused by a sound wave striking against its outer aspect, moves the malleus bone; this, in turn, moves the middle incus, and this passes the movement on to the innermost part of the stirrup. This, in turn, passes the movement onward to the fluid or *perilymph* in the outermost part of the internal ear, and here the endings of the nerve of hearing receive the stimuli which we recognize as "sounds." (See Plates.)

THE TWO IMPORTANT TUBES OF THE MIDDLE EAR

In addition to these contents of the middle ear there are also two tiny openings which, very necessary for health, are nevertheless sometimes a pathway by which serious disease may attack the ear and destroy the hearing. The first is a small passage-way leading from the upper part of the middle ear cavity through the bone to the *mastoid antrum*, a hollow space in the prominent mass of bone to be felt immediately behind the ear projecting outward and downward from the skull.

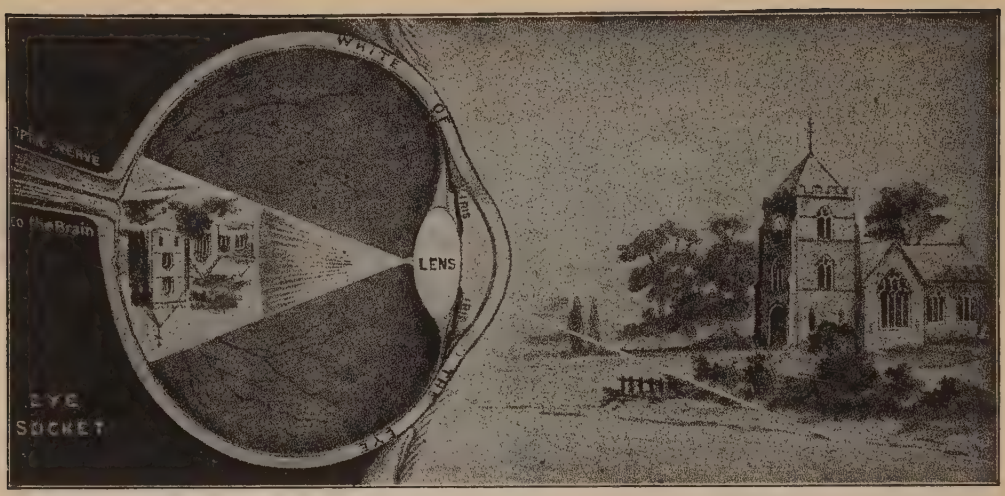
The second passage-way opening into the middle ear cavity is that of the Eustachian tube which leads directly to the back of the throat. The importance of this tube is that through it air can find its way directly into the middle ear, so that the air pressure on the two sides of the drum is always kept the same. If it were not for some such arrangement the pressure on the outer side of the drum would become greater than that on its inner surface. This would, of course, push the drum inward, and greatly reduce its mobility.

EXPLANATION OF THE INTERNAL EAR

This is a complicated structure of bony passages curled on themselves, roughly as in a snail shell, and lined with a delicate membrane. This membrane is, so to speak, floating in fluid. The layer of fluid between it and the bone is called the *perilymph*, while the two layers of the membrane enclose a similar fluid termed the *endolymph*. The internal ear or membranous labyrinth may be divided roughly into three chief parts: (1) the cochlea, the true organ of hearing; (2) the semi-circular canals, which control the act of balancing; and (3) the vestibule, or introductory chamber to the semi-circular canals.

The cochlea is a collection of three tubes curled up on themselves in snail-shell fashion.

The central canal of these three is the connecting link by which the sound waves, passed along over the three tiny bones—the malleus, incus, and stapes—finally reach the endings of the main nerve of hearing, the auditory nerve. (See Plate.)



THE EYE AND ITS WONDERFUL STRUCTURE

The human eye is a hollow globe containing fluids and the crystalline lens. Surrounded by its muscles it lies embedded in a cushion of fat in a conical bony hollow called the orbit. Through an opening in the bones making up the back of the orbit, the optic nerve leads from the back of the eye to the brain.

THE EYELIDS AND EYE-LASHES

The eyelids are made of layers of muscle and cartilage with an outer surface of skin and an inner surface which is a continuation of the conjunctiva that covers the eyeball. In the edge of the eyelid a series of tiny glands are embedded. The mouths of these open on the margin of the lids. The eye-lashes, whose duty it is to act as a screen, preventing foreign bodies such as dust or other air-born objects getting into the eye, are also inserted in the edge of the lid.

WHAT MAKES THE TEARS FLOW

About one-eighth of an inch from the internal angle of the eye, a small projection is to be seen on the margin of the lid. In the center of this is a tiny opening through which the tears as they collect in the eye are led away through two small canals to the lachrymal sac in the upper part of the nose. The lachrymal gland, which secretes the tears, or water, of the eye, is situated above on the outer side of the eyeball, between it and the bones of the orbit. The lachrymal gland is constantly secreting tears, which are carried by narrow ducts to the upper surface of the eyeball, whence they flow down over the eye, finally being collected at the inner corner of the eye and passing into the nose through the lachrymal punctures described above. Under certain circumstances, as from emotion, a blow, or the irritation of a cold wind, the tear fluid is secreted faster than it can escape through the punctures, and so flows over the lids and down the cheeks.

HOW THE EYE IS HELD IN PLACE

The eye is held in its socket or orbit by (1) the optic nerve, (2) by its six muscles attached to various points of its circumference, (3) by the conjunctiva, which is reflected off from its attachments to the outer coat of the eye directly on to the lids, and (4) by the eyelids themselves.

HOW THE EYE IS CONSTRUCTED

The *cornea* is the transparent, bulging, central portion of the eye covering the pupil and the colored iris. Made of tiny transparent cells closely packed together, the cornea is not nourished by blood carried to it by the blood-vessels but by lymph which permeates through it in the tiny channels between the cells. By its curved surface it plays a part in focusing rays of light on to the lens situated just behind the iris.

DIAGRAM SHOWING HOW SOUND WAVES ARE CONVEYED TO THE BRAIN.

Directly behind the cornea come the *iris* and *pupil*. The latter is nothing more than a hole in the center of the iris through which light enters the eye.

How the light is regulated

The iris is the screen of the eye. Just as the photographer uses a screen with a large opening when he wants more light to enter his camera and a small opening when he requires less, so Nature arranges that the iris automatically contracts or dilates to make a larger or smaller pupil opening, according to the amount of light needed within the eye for purposes of vision. When the light is very bright less is needed in the eye. Thus in brilliant artificial light at night one's pupil is small. On the other hand, when the light is waning, as in the dusk or semi-darkness, the pupil is enlarged by the iris contracting down to a narrow ring under the outer circumference of the cornea.

What determines the color of the eye

The color of the eye depends on the position and amount of pigment cells in the iris. In the dark brown eye there is an abundance of pigment scattered through the substance of the iris as well as in the front layers nearest the surface. In the blue eye the pigment cells are buried deep in the iris and are fairly plentiful in amount. The colorless eye of the albino is the result of a deficiency of pigment in the iris.

The iris is fixed at its outer circumference, but its inner rim, which makes the border line of the pupil, is free, so that when the iris contracts the pupil becomes larger, since its inner free margin is drawn outwards toward the fixed outer margin. Close up against the deeper surface of the iris comes the crystalline lens.

Why and how we see

The lens is a compact body of transparent cells, bi-convex in form, and closely similar to the glass lens of a camera. The lens of the eye, however, differs from the camera's glass lens because it changes its shape in focusing for objects at different distances. This focusing, which takes place automatically, is known as "accommodation."

The object of the change in the shape of the lens is that no matter at what angle the rays of light reflected from the object looked at fall on the outer surface of the lens (through the opening in the iris), they may be accurately focused on the surface of the retina, or lining membrane at the back of the eye. When looking at a distant object the lens is fairly flat, because when in this position the rays of light will be accurately focused on the retina. If the eye is now turned to an object near at hand the rays of light from the object are more divergent than in the previous case, and if the lens retained its previous shape they would fail to be focused accurately on the surface of the retina. Hence Nature has arranged that the lens of the eye is elastic, automatically becoming flatter by the action of the ciliary muscle when distant objects are looked at and rounder or deeper when nearer objects are looked at.

Effect of age upon the lens

Up till middle age the eye retains in full this power of automatic accommodation. From middle age onward, however, the lens becomes less and less elastic. As a result the lens constantly remains more or less flattened. Although vision for objects at some distant from the eyes remains perfect, oldish people very frequently have to wear glasses (to correct the too great flatness of the natural lens) to obtain clear vision of objects close at hand.

What holds and surrounds the lens

The lens is slung in a ligament that is a part of the "ciliary body," which is a continuation of the choroid coat of the eyeball. This ciliary body is a ring of tissue lying behind the iris connected with the anterior portion of the choroid coat of the eye.

Between the iris and the underlying lens on the one hand and the inner surface of the bulging cornea on the other is a small space or cavity filled with a clear transparent fluid called the *aqueous humor*.

The coats of the eye

Looking at the white of the eye, the first coat is the transparent conjunctiva,

which is reflected back on to the eyeball from the eyelids. Next comes the sclerotic coat, formed of dense whitish tissue, which seen through the transparent conjunctiva makes up the "white of the eye." The sclerotic coat covers the whole globe of the eyeball with the exception of the transparent bulging cornea in front (which, however, is practically a continuation of the sclerotic), and the back of the eye where the optic nerve enters. The sclerotic is the thickest and densest coat of the eye.

Within the sclerotic coat, and so to speak lining it, comes the choroid coat. Countless blood vessels run through this coat, supplying both the one above it and that beneath it. As this coat approaches the front of the eye under the circumference of the cornea, it thickens into the ciliary body, forming a dense ring of tissues underneath the junction of the cornea and the sclerotic coat.

The Work of the Retina

The innermost coat of the eye is called the retina. This coat contains the nerve endings of the optic nerve which, coming through the opening in the bony orbit, passes through the sclerotic and choroid coats. After entering the eye, the optic nerve divides into myriads of fibers, which, spreading from the point of entrance at the back of the eye, form a fibrous network all over its inner surface. In addition to this network of nerve fibers and highly specialized nerve cells, tiny blood vessels entering with the optic nerve branch out on all sides over the retina.

The Rods and Cones

The retina is a comparatively thick membrane composed of eight layers of different kinds of nervous tissue. The essential layer, that of the "rods and cones," is the seventh from within outward. Thus a ray of light on entering the eye must pass through six superficial layers before it reaches the "rods and cones."

The "rods and cones" are lying on a layer of colored or pigment cells whose duty it is to prevent diffusion of light within the eye. The eyeball, therefore, is to all intents a camera obscura, the iris representing the shutter, the crystalline lens the camera lens, and the layer of "rods and cones" the sensitive plate. When a ray of light falls on the layer of the "rods and cones," this layer receives a nervous stimulus which is conveyed by the optic nerve to the brain. *It is these sensations which the brain translates into what we term sight.*

Where the optic nerve enters the back of the eye, there are no "rods and cones," hence rays of light falling on this portion of the retina send no stimulus to the brain; in other words, images falling on the "blind spot" are not visible.

The "yellow spot" is a small area at the center at the back of the eye where the retina is very thin, consisting of little more than a single layer of "cones." Images which fall upon this region are seen with the greatest distinctness.

How the Sense of Sight Is Produced

Sight is a nervous sensation due to the translation by the brain of the effects caused by rays of light being reflected from some object in front of the eye on to the innermost layer of the eye, the retina.

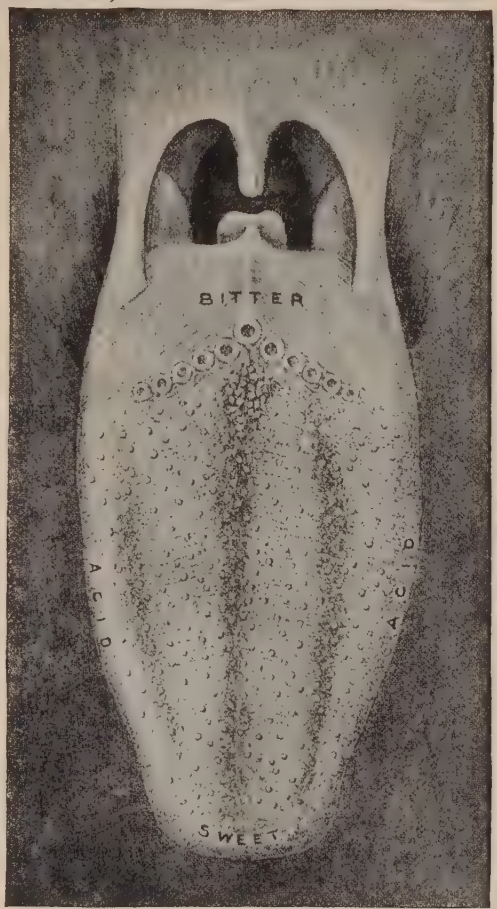
When an object is looked at, rays of light which reach the object from some source of light (such as the sun, a lamp, etc.) fall on the transparent outer part of the eye, the cornea. On account of its curved surface these rays of light are more or less bent inward so as to fall more or less perpendicularly on the forward anterior convex surface of the lens. If the light is weak or dim, the iris, which lies in front of the lens, will automatically contract down so as to make the opening by which the rays can enter the posterior chamber of the eye (the part behind the lens) as large as possible.

If the light is very bright the muscle fibers in the iris will relax so that the iris itself gets larger, and its central opening smaller, so that too much light may not enter. Passing through the lens the rays are focused by the lens so that they are brought together to a point exactly on the surface of the retina.

Here their presence has a certain effect on the rod and cone layer of the retina, the result of which is conducted along the optic nerve to the brain, where it is transformed into what we know as sight.

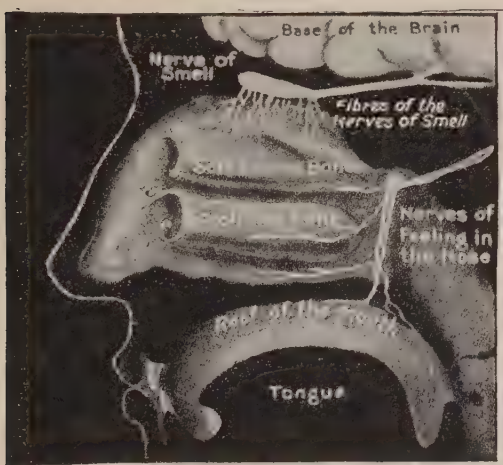
HOW THE NERVES RUN INTO THE SPINAL CORD ON THE WAY TO THE BRAIN

The lower drawing shows how the spinal cord rests in the backbone, and how the nerves pass in and out, those of sensation passing into the spinal cord, as shown in the magnified section above.

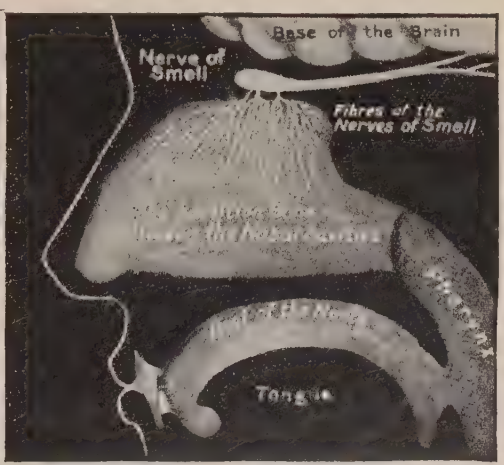


THE AREAS OF THE TONGUE IN WHICH THE CELLS OF TASTE ARE DISTRIBUTED

The tongue is covered with various types of taste-bulbs, most of the distinct types that appreciate the sweet, the acid, and the bitter being found in the areas marked on the diagram.



THE OUTER SIDE OF THE NOSE, SHOWING THE NERVES OF SMELL AND FEELING



THE INNER PART OF THE NOSE, SHOWING THE FIBRES FROM THE OLFACTORY BULB

THE NOSE: ORGAN OF SMELL

The nose is composed partly of bone and partly of cartilage, the cartilages being firmly attached to the bones and to one another by fibrous tissue.

The bridge consists of the two nasal bones which are projections of the frontal bone of the forehead. From these are continued the nasal cartilages which form one-half to two-thirds of the external nose.

The interior is a large and complicated chamber divided into the right and left nares, or nostrils, by the partition called the *septum*. This, like the external part, consists of cartilage in front, attached to bone at the back.

The Nostrils, opening on the face in front, run backward for about two inches and open into the pharynx behind. But the single canal is divided into three separate passages some distance inward. This division is effected by the turbinated bones which jut out into the nostril and thus form the upper, middle, and lower air-channels. In this way the warm surface with which cold inhaled air comes in contact is greatly enlarged.

From the mouth cavity the nose is separated by the hard palate. On the external nose, scattered near the tip, are numerous hairs, sebaceous glands, and sweat glands. These glands are very liable to get blocked, giving rise to inflamed spots, and when hairs are pulled out small abscesses are apt to form.

Membrane.—The whole of the interior surface is lined with mucous membrane, and as this has a large area, and is very well supplied with blood, it raises the temperature of inspired air. The mucous membrane of the nose is continuous with that of the pharynx. Any inflammation, such as that which constitutes a "cold in the head," is therefore extremely liable to extend backward and finally reach the bronchial tubes and lungs.

Over this membrane spread a multitude of small threads or nerves resembling the twigs of a branch; there are many such branches within the nostril, and they join together so as to form larger branches, which may be compared to the boughs of a tree. These finally terminate in a number of stems, or trunks, several for each nostril, which pass upward through apertures provided for them in the roof of the arched cavity, and terminate in the brain.

We have thus, as it were, a leafless nerve-tree whose roots are in the brain, and whose boughs, branches, and twigs spread over the lining membrane of the nostril. This nerve is termed the *Olfactory*.

When we wish to smell anything—for example, a flower—we close our lips and draw in our breath, and the air which is thus made to enter the nose carries with it the odorous matter, and brings it in contact with the ramifications of the nerve of smell. Every inspiration of air, whether the mouth is closed or not, causes any odorous substance present in that air to touch the expanded filaments of the nerve.

In virtue of this contact or touching of the nerve and the volatile scent, the mind becomes conscious of odor, though how it does so we know as little as how the mind sees or hears; we are quite certain, however, that if the olfactory nerve be destroyed, the sense of smell is lost.

Besides its endowment by the olfactory nerve, or nerve proper of smell, the nostril, especially at its lower part, is covered by branches of another nerve (known to anatomists as the fifth), of the same nature as those which are found endowing every part of the body with the susceptibility of heat, cold, smoothness, roughness, pleasure, and pain. It is on this nerve that pungent vapors, such as those of smelling-salts, strong vinegar, mustard, and the like, make the sharp impression with which all are familiar.

Can the Sense of Smell be Educated?—The extent to which the sense of smell may be educated far exceeds what most imagine can be realized from this sense. There are probably as many odors as there are colors or sounds; and the compass of one nostril in reference to the first, likely differs as widely from that of another, as the compass of the eye or the ear does in reference to the last two. The wine merchant, the distiller of perfumes, the manufacturer of drugs, the grower of scented plants, the epicure in things savory, the tobacco dealer, and many others, have by long training educated themselves to distinguish differences of odor which escape an uneducated and unpracticed nostril, however acute by natural endowment.

Perfumes.—Much importance attaches to the use of perfumes by both ancient and modern civilized nations. But all the ancient nations who had attained to civilization, were addicted to the use of perfumes to an extent to which no modern people at the present day affords any parallel. Not merely as contributing to the luxury of the body were perfumes so prized. They were used at every sacred ceremonial; lavishly expended at the public religious services; and largely employed at the solemn rites which were celebrated at the burial of the dead.

THE TONGUE: THE ORGAN OF TASTE

The organ of taste is generally held to be synonymous with the tongue, but, in reality, the throat and the nostril are as much concerned as the tongue in the perception of taste. The power of these portions of the body to distinguish savors mainly depends, as in the case of the eye and the ear, upon their connection with the brain through those fine white nerves which have been already referred to. The tongue and the auxiliary organs of taste are largely supplied with nerves, and through them those sensations are experienced which we connect with the words taste, savor, sapidity; sweet, salt, sour, bitter, and the like.

Membrane of the Tongue.—At certain points the membrane of the tongue forms distinct folds, containing fibrous or muscular tissue, which act to a certain extent as ligaments to the tongue. The most considerable of these folds is termed the *frænum* (or bridle) of the tongue, and connects its anterior free extremity with the lower jaw. Other folds of mucous membrane pass from the base of the tongue to the epiglottis; while from the sides of the base, passing to the soft palate, are seen two folds on either side, the "pillars of the fauces."

The upper surface of the tongue is divided into two parts by a long furrow, commencing at the tip, and extending back about two-thirds of the tongue's length.

Muscles of the Tongue.—The muscles of the tongue are usually divided into two groups—*viz.*: the *extrinsic* muscles, which attach the tongue to certain fixed points external to it, and move it on them; and the *intrinsic* muscles, which pass from one part of the tongue to another, constitute its chief bulk, and move it on itself. These intrinsic muscular fibers run vertically, transversely, and longitudinally, and are so interlaced as mutually to support one another, and to act with the greatest advantage.

The Bulbs of Taste.—The mucous membrane is invested by stratified cells, which, over the surface of the tongue, cover little vascular projections termed papillæ. At the back of the tongue are some eight or ten papillæ of quite a different nature, called "circumvallate." They are arranged to form a V with its angle pointing backward. In the epithelium lining the trenches between the papillæ, curious little bodies called taste-bulbs are lodged. Each taste-bulb looks like a flask-shaped barrel or box, the walls of which are composed of flat elongated cells fitted side by side like the staves of a cask. The taste-bulbs open each by a little pore into the trench, and into the deeper part a nerve enters. The impressions are carried by the nerve directly to the brain in either the fifth or the ninth cranial nerves.

Before the substance can stimulate the terminals it is necessary for its aromatic principles to be in solution. This is generally effected through the agency of the saliva.

Four distinct gustatory qualities are appreciated by the sense of taste—sweetness, bitterness, acidity, and salinity. The intensity of the sensation of taste varies with (1) the area of the surface stimulated, (2) the concentration of the stimulant, (3) the length of the period of application, and (4) the temperature of the substance tasted. Tractile impressions, such as harshness, coolness, and astringency, are erroneously attributed to taste.

Mis-Educated and Educated Taste.—Of all the organs of the senses, that of taste is probably the one which receives the worst usage at our hands. The eye, the ear, and the nose are not educated at all, or their education is left to chance, but the tongue is deliberately mis-educated, perverted, and led astray. We eat what we should not eat; drink what we should not drink; eat too much of what we may eat, and drink too much of what we may drink. And the result is, that we ruin our health, enfeeble our bodies, dull our intellects, brutalize our feelings, and harden our hearts.

Yet assuredly taste has its legitimate domain, and it is as unworthy of man's true dignity that he should be content to live upon the husks that the swine do eat, as that he should be miserable if he do not fare sumptuously every day. All the other senses have a direct interest in the practical decisions of the sense of taste. Drunkenness and dyspepsia dim the eye, dull the ear, blunt the nostril, and make the hand tremble.

A Victim to the Other Senses.—The sense of taste, in truth, is at the mercy of the other senses; and though it can revenge itself for their neglect or misuse of it, it is a sufferer by its own revenge.

Helpless, selfish, and exacting, the dependent of the other senses, and the servant of the body rather than of the soul, it frequently links us more with the lower animals than with higher existences, and has no element of etherality about it.

A feast, indeed, may furnish pleasure to every sense, but it is usually not till hunger is appeased that the higher senses are ministered to. But the tongue, as the organ of taste, is the commissary-general, without whose supplies the other senses can acheive no conquests, and it is entitled to its share in the honors assigned to the united five; but its own sword is seldom drawn, and its aspect is not heroic.

THE HAND: CHIEF ORGAN OF TOUCH

The last of the bodily senses is *Touch*. It has the widest gateway, and largest apparatus of them all; for though we are in the habit of speaking of it as localized in the fingers, it reigns throughout the body, and is the token of life in every part. The nearest approach to death which can occur in a living body, is the condition of paralysis or palsy, a death in life, marked in one of its forms by the loss of that sense of touch which is so marked an endowment of every active, healthy creature.

The tactile susceptibilities of the skin depend, as do the peculiar endowment of the other organs of the senses, on its plentiful supply with those wondrous living nerves, which place in vital communication with each other all the organs of the body, on the one hand; and that mysterious living center, the brain (and its adjuncts), on the other.

Our simplest conception of an organ of sense is supplied by the finger, which whether it touches or is touched, equally realizes that contact has been made with it, and enables the mind to draw conclusions regarding the qualities of the bodies which impress it. Now, after all, every one of the organs of the senses is but a clothed living nerve conscious of touch, and they differ from each other only in reference to the kind of touch which they can exercise or feel. Keeping in view that to touch and to be touched is in reality the same thing, so far as the impression of a foreign body is concerned, we can justly affirm that the tongue is but a kind of finger, which touches and is touched by savors; that the nostril is touched by odors; the ear by sounds; and the eye by light.

The *Hand* is emphatically the organ of touch, not merely because the tips of the fingers, besides being richly endowed with those nerves which confer sensitiveness upon the skin of the whole body, possess in addition an unusual supply of certain minute auxiliary bodies, called "tactile corpuscles," but because the arrangement of the thumb and fingers, and the motions of the wrist, elbow, and arm, give the hand a power of accommodating itself spontaneously to surfaces, which no other part of the body possesses. Moreover, when we speak of the hand as the organ of touch, we do not refer merely to the sensitiveness of the skin of the fingers, but also to that consciousness of pressure upon them in different directions, by means of which we largely judge of form.

When a blind man, for example, plays a musical instrument he is guided in placing his

fingers, not merely by the impression made upon the skin of them, but also by impressions conveyed through the skin to these little bundles of flesh called muscles, which move the fingers.

In many respects the organ of touch, as embodied in the hand, is the most wonderful of the senses. The organs of the other senses are passive, the organ of touch alone is active. The eye, the ear, and the nostril stand simply open: light, sound, and fragrance enter, and we are compelled to see, to hear and to smell; but the hand selects what it shall touch, and touches what it pleases. It puts away from it the things which it hates, and beckons toward it the things which it desires; unlike the eye, which must often gaze transfixed at horrible sights from which it cannot turn; and the ear, which cannot escape from the torture of discordant sounds; and the nostril, which cannot protect itself from hateful odors.

Moreover, the hand cares not only for its own wants, but, when the other organs of the senses are rendered useless, takes their duties upon it. The hand of the blind man goes with him as an eye through the streets, and safely threads for him all the devious ways; it looks for him at the faces of his friends, and tells him whose kindly features are gazing on him; it peruses books for him, and quickens the long hours by its silent readings.

It ministers as willingly to the deaf; and when the tongue is dumb and the ear stopped, its fingers speak eloquently to the eye, and enable it to discharge the unwonted office of a listener.

The organs of all the other senses, also, even in their greatest perfection, are beholden to the hand for the enhancement and the exaltation of their powers.

It constructs for the eye a copy of itself, and thus gives it a telescope with which to range among the stars; and by another copy on a slightly different plan, furnishes it with a microscope, and introduces it into a new world of wonders.

It constructs for the ear the instruments by which it is educated, and sounds them in its hearing till its powers are trained to the full.

It plucks for the nostril the flower which it longs to smell, and distills for it the fragrance which it covets.

As for the tongue, if it had not the hand to serve it, it might abdicate its throne as the "Lord of Taste." In short, the organ of touch is the minister of its sister senses, and, without any play of words, is the handmaid of them all.

And if the hand thus munificently serves the body, not less amply does it give expression to the genius and the wit, the courage and the affection, the will and the power of man. Put a sword into it, and it will fight for him; put a plow into it, and it will till for him; put a harp into it, and it will play for him; put a pencil into it, and it will paint for him; put a pen into it, and it will speak for him, plead for him, pray for him.

What will it not do? What has it not done? A steam engine is but a larger hand, made to extend its powers by the little hand of man! An electric telegraph is but a long pen for that little hand to write with! All our huge cannon and other weapons of war, with which we so effectually slay our brethern, are only Cain's hand made bigger, and stronger, and bloodier!

What, moreover, is a ship, a railway, a lighthouse, or a palace—what, indeed, is a whole city, a whole continent of cities, all the cities of the globe, nay, the very globe itself, in so far as man has changed it, but the work of that giant hand, with which the human race, acting as one mighty man, has executed its will!

What an instrument for good it is! What an instrument for evil! and all the day long it never is idle. There is no implement which it cannot wield, and it should never in working hours be without one. It is the one universal craftsman. For the queen's hand there is the scepter, and for the soldier's hand the sword; for the carpenter's hand the saw, and for the smith's hand the hammer; for the farmer's hand the plow; for the miner's hand the pick; for the sailor's hand the oar; for the painter's hand the brush; for the sculptor's hand the chisel; for the poet's hand the pen; and for the woman's hand the needle.

For each willing man and woman there is a tool they may learn to handle; for all there is the command, "Whatsoever thy hand findeth to do, do it with all thy might."

Such are the five entrance-ways of knowledge, which John Bunyan quaintly styles Eye-gate, Ear-gate, Nose-gate, Mouth-gate, and Feel-gate.

BOOK OF THE CHILD WORLD

PHYSICAL LIFE OF CHILDREN : Work and Play

THE CHILD, THE PARENTS AND THE SCHOOL

THE MENTAL LIFE OF THE CHILD : Story-land, Nature-land, School-land

SIMPLE LESSONS : Words, Reading, Writing, Numbers, etc.

THE MORAL LIFE OF THE CHILD : Conduct, Manners and Etiquette, Adolescence, Habits, Cultivation of Ideals, etc.

MANHOOD, WOMANHOOD, PARENTHOOD

THE MOTHER AS TEACHER—*Sculptured by E. Delaplanche*

In the above masterpiece we have a vivid and sympathetic portrayal in eternal marble of the universal mother-instinct to instruct and educate her children. This she does in accordance with the measure of her own mental equipment, her previous advantages, and a mother love which frequently means patience, sacrifice and anxiety. But the instinct is always present and must continue while the human race lasts—ever *onward* and upward.

THE CHILD WORLD

THE GROWING BODY—WORK AND STUDY—FOOD—THE NERVOUS SYSTEM—PUBERITY —REST AND SLEEP—THE EYE—THE EAR—OTHER SENSES

THE HEALTH OF CHILDREN DURING SCHOOL LIFE

Children begin school life at an age which is, unfortunately, one of the greatest importance in their physical development. It is a truism that no mechanism, whether animate or inanimate, can do two things at once and get as good results as when all its efforts are being directed toward one object. So it is obvious that any vital energy used in developing a young child's brain must be taken away from the amount that had hitherto been entirely devoted to physical growth. Too often this fact is lost sight of both by energetic teachers and ambitious parents.

Instead of being delighted with the rapid development of the child's mind, parents should receive any evidences of abnormal advancement with some suspicion of its true worth.

WHEN THE CHILD FIRST GOES TO SCHOOL

At the age of six, when the average child first goes to school, practically everything he sees is new and interesting, and worthy of deep consideration. His brain gets no rest from the time he wakes until he goes to sleep at night.

To do its work, the brain needs a full and active blood supply, and this it will take often at the expense of leaving an inadequate amount for the demands of the rest of the body.

Curiously enough, excessive mental activity seems to have no stunting effect on the growth in the way of height. It is in breadth and thickness that the body suffers. Everyone is familiar with the tall, lanky boy or girl in the early teens who is said not to care much for games and exercise, and is, unfortunately, "rather delicate." This youngster is almost certain to be pointed out by the proud parents as being extremely well up in his studies.

Short of encouraging laziness or indolence at school, it really makes very little difference to the ordinary man or woman, so far as their adult mental attainments go, whether they were ranked as fairly good scholars or fairly poor ones when they were young children. On the other hand, the effort necessary to be made by a sensitive, not over-

WHAT NATURE'S DOCTORS PRESCRIBE FOR CHILDREN

brilliant child to keep a good place among its fellows may have a serious physical effect that will hamper him or her throughout life.

The effort should be made when a child is first sent to school to determine just how much work he can do comfortably and happily. If an attempt is made to force him to do more than this, he will become depressed and worried. With children, any mental worry will shortly produce unmistakable signs on the physique. It is a bad plan to attempt to get as much as possible out of a child; there should always be a certain amount of vital energy left for emergencies.

IMPORTANT CONDITIONS AFFECTING THE CHILD'S LESSONS

With young children, no lesson should last for more than half an hour, and if possible, a short interval between each lesson should be spent in the open air. If the young scholar is notably in advance with his school work, discourage this; or, at any rate, carefully consider whether his health will allow such active development. If backward and seemingly lazy, the cause of the indolence should be sought first in the physical condition before the character is assailed.

Above all, no child under fifteen should have to do any routine night study to keep up in his lessons. Young eyes are easily strained, and young bodies are easily tired. Watch a tired child who has to study at night; he will get his body in the most comfortable position he can manage, and will take no thought of the direction from which the light falls on his page. Nor has he the energy to hold his book so that the plane of the lines is always parallel to that of his eyes.

His mind may accumulate a little extra book knowledge by such work, but only at the risk of strained eyes and possible spinal defects. Lateral curvature of the spine, in a great majority of cases, may be traced back to habitual faulty postures used by children when at school work. A fair rule to make about night work is to allow a child to study at home only so long as he will comfortably sit upright and hold his book at a correct angle.

In children, the physical state is a very good guide to the mental condition. If the body is tired, the mind is in no fit state to absorb knowledge. The thin, narrow-chested, delicate youth, perhaps with strained eyes and nearly always with a good school record, is nine times out of ten a preventable mistake.

If, when first he showed signs of more than average scholarship, his parents had noted that this superiority was due principally to work done when physically tired, and to neglect of outdoor games and general "play," a little sense of the comparative worth of health and youthful scholarship would have given him a greater chance of developing into a valuable citizen.

THE PROPER TIME FOR WORK

A child's brain, and its body as well, are in the prime of their vigor during the morning hours. From nine till noon, therefore, should be the period of the hardest mental or physical work he undergoes. Evening preparation of lessons is harmful, not only because it tends to bring into a state of high activity the brain, which shortly should be quiet and ready to sink into slumber, but also because it throws hard work on an already fatigued organ. Much of the nervousness, debility, and insomnia so common among school children can be traced to evening preparation.

NECESSITY OF ABUNDANT FOOD

The more actively growing the tissues, the greater the need for abundant nourishment. The growing child, therefore, requires more food in relation to his size and weight than does the grown person who has passed the stage of rapid development.

No fixed rule can be laid down as to how much a child should eat. Generally speaking, the country-bred child, living an outdoor life, may rely on his own appetite as a guide. On the other hand, the city child, living a more indoor artificial life, may have little appetite, and as a result, if not watched, may lapse into a condition of malnutrition simply through underfeeding. The best guide, perhaps, is the child's weight. If he is continually below weight, this fact may in all cases be taken as proof either that the child's food is unsuitable to its age and digestive powers, or else deficient in amount.

EFFECT OF THE SEASONS ON THE NERVOUS SYSTEM

The effect of the change in seasons is much more marked in children than in grown people. In the Spring in particular the watchful mother should keep a careful eye on the health of her little ones. "There come with the Spring in many children," writes a noted physician, "a restlessness and excitability, a perversity and irascibility of temper, or a listlessness, and indisposition for exertion that are not displayed at other times; and there come then, also, more plentifully than at other seasons, physical indications of debility and the scrofulous habit, such as enlarged glands and tonsils, dyspepsia and loss of appetite, strumous ophthalmia, discharges from the ear, and enlargements of joints."

The moral is that since the body is growing fastest (and therefore has the greatest need of husbanding its vitality) in the Spring time, any extra pressure on the nervous system as from prolonged school hours, or any undue exertion, should be strenuously avoided. Unfortunately with the "final" examinations in the early summer, our school systems demand that the hardest and most strenuous work of preparation falls in the Spring time, the season at which the body is least fitted to withstand abnormal stress.

When a child or growing boy or girl becomes more nervous in the Spring time than is his usual habit, or becomes depressed in mind, or constantly complains of being tired, the only common-sense treatment is to put an end at once to all schooling for the time being, and to turn the child out-of-doors every day for all the hours of sunlight.

THE PERIOD OF PUBERTY AND ITS SPECIAL PROBLEMS

Parents should ever be watchful regarding the education of their young children when they approach the age of puberty, that is, the period when the child begins to develop into the man or woman.

Profound and rapid changes take place at this period in mind, brain, the nervous system, the glandular system, and, one may indeed say, in the body generally. The nerve centers temporarily lose some of their normal stability, and such conditions as insanity, hysteria, and epilepsy, rare in childhood, now become common. Even though no actual nervous disease develop, there is quite commonly during this change from childhood to adult life a period of nervous excitability and exhaustion accompanied by physical weakness, which to a great extent unfits the young person for close pursuit of his or her studies. Particularly in young girls is there the greatest necessity for curtailing any tendency to overwork at school during this period.

CONDITIONS OF BONES AND MUSCLES AT THE PERIOD OF PUBERTY

At this time there is also rapid growth and development of the bones which lengthen rapidly, and are still soft and cartilaginous in places. It is all-important at this period, therefore, that the muscles on the two sides of the body receive roughly the same amount of use, otherwise there is grave danger of some deformity, such as lateral curvature of the spine, developing.

While the bones are in this condition of rapid development, all muscle-straining attitudes, such as sitting upright at a desk, practicing at the piano, writing, painting, etc., should be kept within such limits as never to entail real fatigue. Young girls at this period, even more than boys, require all their strength and vitality to support them in their rapid growth. This does not mean, however, that all muscular exercises must be forbidden during the period of puberty, which may be reckoned as from twelve to sixteen in girls, and from thirteen to sixteen in boys. The point is that violent, really fatiguing exercise, such as hockey, hunting, cycling tours, mountain climbing, etc., as well as all occupations which entail the holding of the muscles tense and fixed in one position for a long period, should be indulged in very sparingly, if at all. The young girl can obtain all the exercise necessary for health in less strenuous outdoor pursuits such as golf, croquet, a little not too strenuous tennis, walking, etc.

GENEROUS HOURS OF SLEEP SHOULD BE ALLOWED

While moderate mental work does not in the healthy grown person necessitate an increase in the amount of sleep, the child at school, constantly using his brain in the accumulation of new ideas,

needs an even more generous proportion of sleep than if his brain were not so occupied. Again, if the child shows any signs of nervousness, he ought to be allowed to sleep a little longer than the more stolid non-temperamental child. The following is the average duration of sleep required at different ages:

4 years of age	12 hours
7 years of age	11 hours
9 years of age	10½ hours
14 years of age	10 hours
17 years of age	9 hours

Up to the approach of puberty (the change from childhood to adult life) a child may well be allowed to sleep a little later in the morning in the winter than in summer. Again, if as is frequently the case, he should suddenly commence to grow in height very rapidly an extra hour or half-hour in bed may be of the greatest service in weathering the strain of the rapid growth.

Precautions to Prevent Sleeplessness

Insomnia is sometimes very troublesome in young children, demanding most painstaking treatment. Most important in encouraging the habit of going to sleep immediately on being put to bed is regularity in the hour of bedtime. Unless the child is put into bed at a certain fixed hour with clock-like regularity, the habit of getting sleepy (which is such an important factor in going to sleep) cannot be normally developed.

Sometimes a subdued, shaded light will sooth a nervous child's excited brain and so induce sleep. A child who wakes in terror in a pitchdark room may for years be nervous about going to bed in the dark. Any attempt to stamp out this tendency to nervousness by refusing a comforting glimmer of light in the room may bring on a habit of sleeplessness on first going to bed which may be difficult to eradicate. Sometimes a softly-ticking clock, by affording a sense of companionship, encourages the child to drop off to sleep.

Mental Quietude and Good Ventilation

Another factor in encouraging sleep is a quiet mental state, which is best brought about by the strict avoidance of all exciting games or other mental activities for at least an hour before bedtime. School lessons prepared in the evening are a fertile source of insomnia in children. The brain, keyed up to working at full pitch, cannot quiet down at its owner's wish, and its unwonted activity may banish sleep for an hour or more.

While free ventilation is essential in the child's sleeping-room, it should never be forgotten that the young are more susceptible to cold than are grown people, and have not the same power of generating extra body heat to replace any undue loss of warmth from exposure to outside cold. The temperature of the child's bedroom, therefore, should be kept between 55° and 60° F. If below this, a general feeling of chilliness, and in particular of cold feet, may be the cause of sleeplessness.

Apart from the discomfort and misery caused by the feelings of chilliness, cold feet lead to the adoption of postures in bed which are anything but conducive to health.

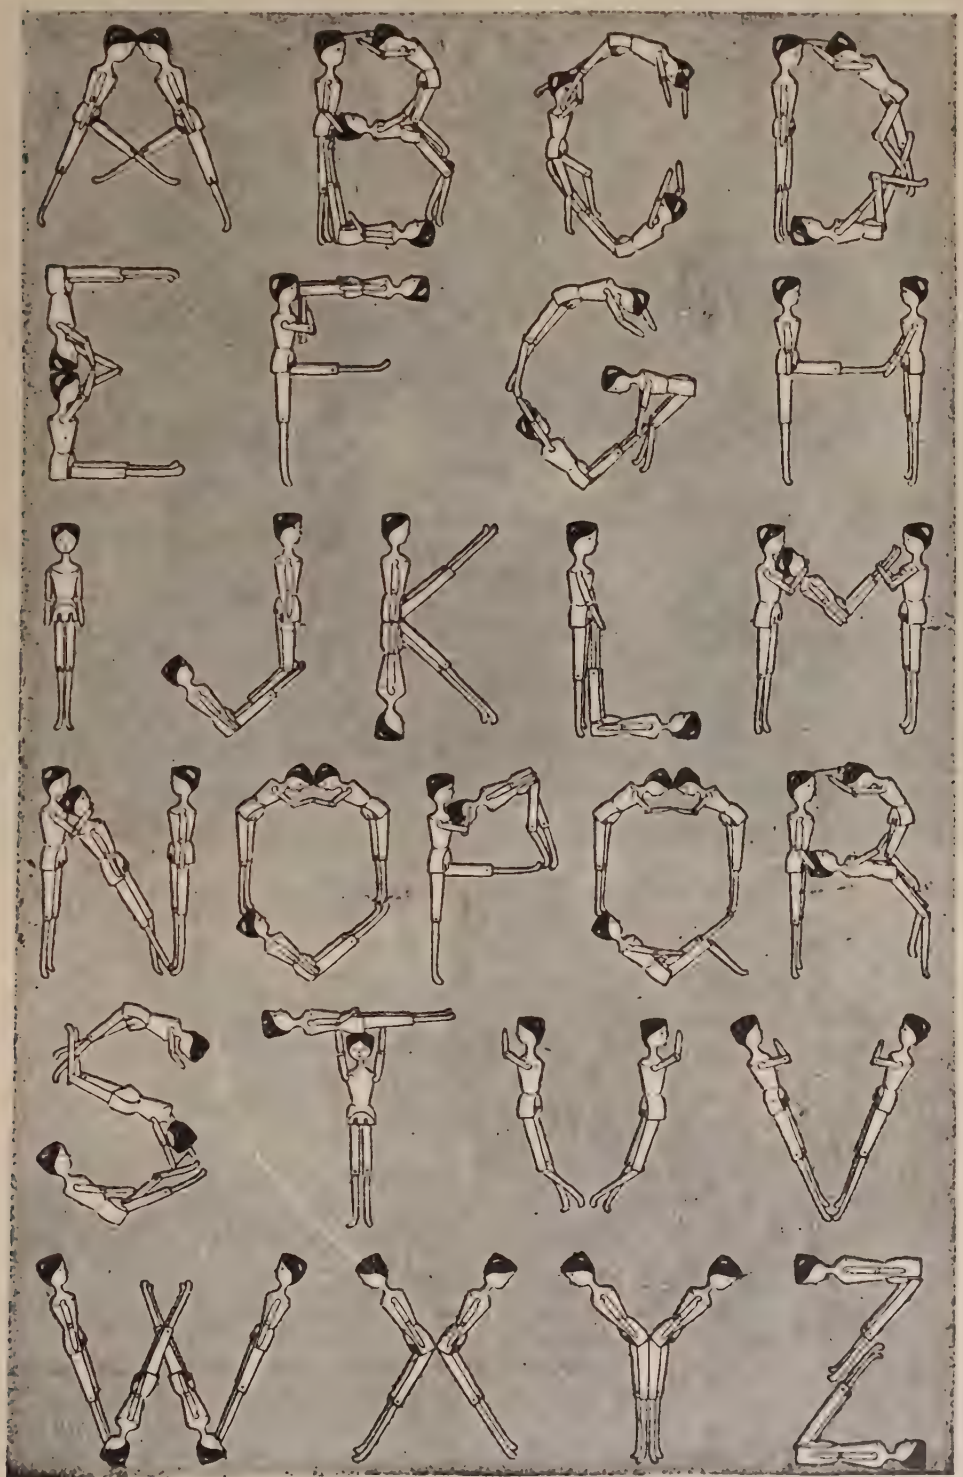
Beneficial Effects of the Bath

In nervous children who sleep badly, a hot bath or a hot mustard foot bath often acts like a charm, the child falling into deep sleep almost as soon as it has been tucked in bed. The warmth, by dilating the blood-vessels, on the surface of the body in the case of the full bath, or of the feet in the case of the mustard foot-bath, draws blood away from the brain and so, reducing its activity, allows it to quiet down into sleep.

Where did you come from, baby dear?
Out of the Everywhere into here.
Where did you get those eyes so blue?
Out of the sky as I came through.
What makes the light in them sparkle and spin?
Some of the starry twinkle left in.
Where did you get that little tear?
I found it waiting when I got here.
What makes your forehead so smooth and high?
A soft hand stroked it as I went by.
What makes your cheek like a warm white rose?
I saw something better than anyone knows.
Whence that three-cornered smile of bliss?
Three angels gave me at once a kiss.
Where did you get this pearly ear?
God spoke, and it came out to hear.
Where did you get those arms and hands?
Love made itself into bonds and bands.
Feet, whence did you come, you darling things?
From the same box as the cherubs' wings.
How did they all just come to be you?
God thought about me, and so I grew.
But how did you come to us, you dear?
God thought about you, and so I am here.

(The above poem was written by George MacDonald, Scottish novelist and poet; born 1824, died 1905. He wrote a long list of novels, stories and poems. His children's poems and stories are deservedly popular, and contain numerous passages of singular beauty, lighted up with fine fancy and descriptive power.)

HOW THE DUTCH DOLLS PLAY THE GAME "ALPHABET"



HOW TO TEACH A CHILD TO READ AT HOME

A a	E e	I i	L l	P p	S s	W w
B b	F f	J j	M m	Q q	T t	X x
C c	G g		N n		U u	Y y
D d	H h	K k	O o	R r	V v	Z z

Above are the big and little letters of the Alphabet.
Below is a story with all these letters in words.

I saw the big ox when I went to the Zoo last week.
It was in a den by the cave and stood near the bars.
I thought it looked quite fierce when it stared at me.
It made me jump when it put its nose out of the bars.
A man fed the ox with some hay that he got from a box.
It then lay down on the hard floor and had a nap.
I should not like to be in the den with the ox.

IT is not a proper test of a child's advance that he should be able to read very early. Neither do we now make the teaching of reading the chief object in first lessons. Rather does the child learn first to master the difficult art of connecting spoken sounds with written signs somehow, on the happy

road from babyhood to schooldays, while his mother still holds him by the hand.

The training of your boy's ear in detecting the sounds that go to make up the words he uses is of the very first importance. You encourage him in the use of language by getting him to talk freely about what you do together, describing in his own pretty way the flowers, birds, toys, pictures that he loves. All the time you are gently insisting on perfect pronunciation, clear, pleasant modulation of his speaking voice, quiet breathing through the nose. Presently, when you see he is quite ready for it, you lay stress on the sounds made at the beginning and end of such words as cat, dog, puss, pig. He will soon copy quite accurately the sounds of the various consonants, and find other words beginning or ending with similar sounds to those in the examples you give.

Later will come the vowel sounds, and patient work will be needed to make him see the difference in the various sounds of a, o, and so on. At this stage it will amuse him to have a looking-glass before him to see how the shape of his mouth alters when speaking. Let him practice working the muscles round his lip and moving his tongue freely. It will also help if he sings the vowels, thus—take deep breath, sing *a* (as in father) as long as the breath lasts; take breath, sing *a* (as in fate), in same way; and so on with all the vowel sounds.

You will, of course, make a table of all the sounds you teach him for your own use, with lists of suitable words, and something has really been accomplished in the numberless five-minute sound-lessons when the child can break up the words he uses into the sounds that go to make them—b-u-n, bun; f-i-g, fig.

So much for the first training in recognizing and reproducing the sounds.

And now we come face to face with the much-discussed question—when and how is a child to learn the letters (the printed signs of sounds) and the names given to these letters? Some children settle this question for themselves by "picking up" these letters and their names from picture-books and blocks with little outside help, but they will find it useful later on to know the *names* of the letters and the *order* of the alphabet. See to it that your boy learns to call the letters by their sounds, not their names, and help him to realize that the letters are the *signs of the sounds*, used to tell us what sounds we are to utter.

You have a sand-tray? Let the fat little finger practice making a round *o* in it, while the rosy lips form the long *o*, as in no and lord, the short sound, as in not; or tracing crooked *s* while he hisses like the geese on the common, or says "puss," "sat," and so on.

If you have a box of good, plain letters, let him pick out the *m* in mouse, the *t* in table and in rat. Your small blackboard will come in handy, for he will be most happy to print on it in chalks the letters as he learns them. Let him model their shapes in clay, draw and paint them in colors, make them out of slips and curves of colored cardboard, varying the practice as much as possible; and see to it that he is never bored. He will soon greatly enjoy identifying and cutting out large and small letters as he learns them from advertisements in big type, and pasting them in a "letter" scrapbook, made by fastening together a few sheets of brown paper. Guide him to class together *v* and *f*, *r* and *l*, *s* and *z*, *b* and *p*, *m* and *n*, *t* and *d*, and the vowels in their order, with a whole page to themselves—this with a view to the time when he begins to study seriously.

But that is looking far ahead. We have now brought him to the point of being ready for his first reading lesson. But do not hurry; give his eyes plenty of distance work, plenty of training in reading Nature's wide-open book, before you put printed books into his hands. He is to be a keen lover of books, so make him want to read, and see to it that he is interested and happy every moment of the time given to his reading lesson.

Here is the method:

Buy three copies of some well-printed simple stories; put one copy aside, and cut up the other two, pasting the sheets on drawing-paper, alternate pages face down, so that you get one complete copy out of the two books.

Now cut up, line by line, and then word by word, the first little story, and put the words in a small tray or box. Perhaps it is, "Thank you, pretty cow." So now print on your blackboard two or

three of the words—*cow*, *milk*, *pretty*, the child earnestly watching and listening while you say the words very distinctly, giving the component sounds as clearly as you possibly can.

Then hand him the tray, and let him pick out the words and name them as you have done. Proceed in the same way with a few more words of the story, printing them as you go in a column on the board, and when he knows them up and down, in and out, the great moment has arrived. Your heart will beat as you put the little book—the copy that was not cut up—into his hands. He can read, so much at any rate, quite readily.

Note that there must be no spelling; it is "look and say." Next day you take word-building with the box of letters, and a fine game you have, based on the words learned the day before. Add letters and syllables in every way you can think of, always giving sounds, not names; let the boy read, copy, take from dictation these new words for a happy twenty minutes. He is now learning to spell, that he may be able to write with the sound signs. Go on like this, reading one day, word-building the next, till several sets of little books have been used up.

Let him dramatize the little stories and poems whenever you can; take parts with him, thus laying the foundation of real, live reading aloud, without any disfiguring mannerisms or self-consciousness. His stock of words grows apace—ten a day will give over three thousand in a year—and little by little, as opportunity offers, the more complex sounds in our language and its puzzling irregularities are unfolded and made familiar. Thus reading, elocution, spelling, writing, all advance together.

The study of Nature should go hand in hand with the study of books. Children love the outdoors—the trees, the flowers, the grass,—all living things. Nature trains the special senses, awakens the powers of observation, and creates a love of both the beautiful and the useful.

THE CHILD'S PICTURE GRAMMAR—NOUNS AND VERBS

A NOUN IS THE NAME OF ANY THING—A VERB TELLS WHAT A NOUN DOES OR IS DONE TO

WHAT OUR DOMESTIC ANIMALS GIVE US

THE USEFUL THINGS OBTAINED FROM THE COW, HORSE SHEEP, GOAT, PIG, FOWL, AND DEER

THE CHILDREN OF THE ANIMALS

A YOUNG DEER IS CALLED A FAWN
A YOUNG HORSE IS CALLED A COLT
A YOUNG COW IS CALLED A CALF
A YOUNG SWAN IS A CYGNET
A YOUNG EAGLE IS AN EAGLET
A YOUNG HEN IS A CHICKEN
A YOUNG DUCK IS A DUCKLING
A YOUNG GOOSE IS A GOSLING
A YOUNG FROG IS A TADPOLE
A YOUNG HARE IS A LEVERET
A YOUNG OWL IS AN OWLET
A YOUNG FOX IS A CUB
A YOUNG GOAT IS A KID
A YOUNG SHEEP IS A LAMB
A YOUNG TROUT IS AN ALEVIN
A YOUNG SALMON IS A GRILSE
A YOUNG DOG IS A PUPPY
A YOUNG CAT IS A KITTEN

The young of some animals have special names, and with many of these we are familiar. But there are other young creatures whose particular names are not so well known. In the pictures on this page we see the young of eighteen different creatures with their mothers, and the special names of these are given.

STORIES: To Tell and To Read

Stories are the "spice" of childhood. The eager delight with which children beg for a story, and listen while it is told, is in itself a plea for stories, and the routine of lessons should be broken up by setting apart five or ten minutes between them for this pleasant exercise.

Use of Stories.—In the first place, story-telling may be made the means of helping the children to acquire familiarity with good English. We all know how limited is the child's vocabulary, and how difficult it is for a child to express his thoughts. Sometimes when a fact is perfectly well known, the language is wanting in which he can express it.

Second, the child's sympathy may be cultivated and developed by means of stories. He becomes intensely interested in the subject of the story, and for the time being almost lives the incident over again in his own little life.

A very little child was one day listening to a story about "A lazy boy who missed a school picnic because he was so slow in getting ready. The school children were all on board the steamer, the bell rang, the moorings were loosed, and away went the boat just as the late little boy came running down to the pier."

The little listener followed the story intently up to this point, and then burst out, "Oh! Auntie, couldn't they get a little row-boat and take him out to the steamer? I don't like him to be left behind."

Stories, then, enlist the sympathy of the child.

Third.—Story-telling strengthens the child's power of imagination. But, be careful to develop the imagination in a right direction, and not to feed it with anything coarse or cruel.

Fourth.—The stories offer opportunity for inculcating moral truths and sometimes it is possible to teach by stories truths that would be difficult to teach in any other way.

Kinds of Stories.—(*a*) *Stories of Real Life*—of events which have actually happened, or would be likely to happen. It is in this kind of story that moral truths can be illustrated most frequently.

(*b*) *Fairy Tales.*—Some people object to fairy tales, but innocent fairy tales feed the imagination, and often point a moral. Stories of horror and cruelty should never be recounted. Children soon learn to take delight in this class of story, and as a consequence, their moral tone deteriorates. Such stories as "Bluebeard" have this effect, but "Cinderella," "Sleeping Beauty," and many others, show that right is victorious in the end, and cannot have any bad effect on the children.

(*c*) *Stories of Nature.*—Flowers, rocks, trees, and other objects in nature may be made the subject of pleasant stories, interesting as a fairy tale, and many important truths may be taught in this way.

(*d*) *Stories for Very Little Ones.*—These should be exceedingly simple. A dog, a kitten, a bird, anything that comes into the life of a little child, he is delighted to hear about. Many such stories are given in the chapters on Numbers and Reading, and others will suggest themselves to the teacher. They should all be told in baby language, *i.e.*, in language that the child can comprehend. Pictures often suggest a story, which is all the more interesting for being thus illustrated.

The children should sometimes be encouraged to tell what they can remember of the story. In this way they learn to express themselves.

The Story-Teller. (*a*) We have said before that the language should be simple and easy to understand.

(*b*) The voice should be modulated, and the story-telling is much more effective when gesticulations are used. The flying of birds, the rustling of leaves, etc., should be accompanied by hand movements on the part of the Teacher.

(*c*) The story-teller should be in sympathy with the subject of the story, and also with the listeners, otherwise the interest will be lost.

(*d*) Just as pictures add interest to a story, so do illustrations on the blackboard, and these should be frequently given. Sometimes the children may be allowed to draw for themselves objects which have been mentioned in the story.

The After-Effect of Stories.—It is well to remember that the child's taste for reading is largely influenced by the class of stories told to him in early life, and in these days of plentiful, cheap literature, how important it is that the youthful mind should be trained to appreciate that which is good.

Story of an Oak Tree

"One day a little girl named Marian went out with her mother to walk in the park. They saw a great many trees, and flowers, and there was one very large tree that they looked at for a long time. It was an oak tree.

"Marian's mother told her many interesting things about the oak tree which she liked very much to hear, and then they went home.

"Next day the little girl came alone to the park, and stood looking again at the old oak tree. Then she swung on the branches until she was tired, and at last she said to herself, 'I will sit down and rest, and think of all that mother told me about this tree.'

"But the day was warm, and Marian was so comfortable, with her head leaning against the old oak, that she soon fell asleep, and then she thought that the oak tree began talking to her.

"'They call me the King of the Forest', said he. I suppose that is because I am so old and strong. My trunk is very rough and rugged, and you see it is broad at the bottom, and grows narrower at the waist, and then curves out broader again.

"'The fresh, green, dancing leaves which you see were at one time folded up in tiny golden buds. What a number of wrappings they did have, to be sure! That was to keep them warm, you know, all through the winter, for *this* year's buds were formed on my branches last year.

"'Do you see these round apples? They were buds once. How did they grow like this, do you ask? Well, a little insect came one day, she found a nice little bud, and made a hole in it. Then she laid some tiny eggs, and put round them some juice which the bud did not like at all, for it spoiled the little folded leaves. So instead of sending out pretty green leaves, the bud grew into a little house and the eggs are all inside. When the tiny grubs came out of their eggs, they will eat their way through the oak apple and so get out.

"'Do you know that the oak apples help to make the ink with which you write?

"'Sometimes a caterpillar comes and rolls himself in one of my little leaves; and in the autumn, when my nuts are ripe, the squirrel comes to visit me.'

"'Yes,' said Marian, 'your nuts are acorns, how pretty they are! each one of them has a little cup. I do not wonder that the squirrel comes to see you, for he likes your nuts so much.'"

This shows the method pursued in these stories. The oak tree would make many such.

FORM AND COLOR

In many schools a lesson is given on Form and Color at least once a week. The different forms should be kept in a box, in which there should be also squares of cardboard, showing the various colors. This apparatus should, however, be amply extended. Pieces of silk or colored paper should be kept in another box, and colored wools wound on pieces of cardboard show the colors nicely.

The Object of the Lesson.—The object of the lesson is not simply to teach the shape or color of one particular piece of wood, or cardboard, but to enable the child to distinguish the same shape or color whenever it sees an example of it. Thus the child is helped to observe and compare, and its interest in life is strengthened as it learns with joy to find out things for itself.

FORM

The Circle, or round, is the first form to be taught, and it should be illustrated by numerous examples, such as a plate, a round cake, coins, etc.; all these things should be shown to the children.

Then the circle may be compared with the ball, and the children are asked: "What things are round like the ball?" "Orange, apple, etc." "And what things are round like a circle?" "A penny, a shilling, etc." "What has the circle that the ball has not?" "The circle has two flat faces, and the ball has only one round face."

The Square is somewhat familiar to the child, who has noticed the shape of his books, and the table. It has four sides all the same length; this fact may be taught thus:

Take a long stick or ruler. Teacher says: "I will measure the sides of the square. Johnnie shall hold it for me" (measure the top edge, and cut off a piece of stick just the length). Show it to the children, and say: "This stick is just as long as the top edge of the square. I will give it to Mary to hold. Now we will measure the bottom edge" (again cut the length). "This is the length of it" (holding up the stick).

The right and left sides are measured in the same way, and the child now holds four sticks. Let the children count how many sticks there are, and notice also that all four measure exactly the same, and then they will see that the square has four sides all the same length. Then ask for objects of this shape.

The Oblong is measured in the same way as the square, and the sticks are cut the lengths of its sides. The children then see that the sticks cut to represent the sides of the oblong are not all of the same length, but that two are short, and two longer, so the oblong must have two long sides and two short sides. Let a child point to the two long sides, and another to the short ones.

Then the children are asked to name all the things they can see that are oblong in shape, such as the table, door, window. They may also name objects at home—dresser, piano, bed, and many other things.

The Oval is frequently taught after the circle, but as the difference between square and oblong is more marked than the difference between circle and oval, the former comparison if taken first may help the child to understand the latter.

Take a square and draw a circle on it, then take the oblong and draw an oval shape upon it. Ask the children, "How is this shape different from the round shape on the square?" "It is longer." "Why?" "Because the oblong is longer."

Now show the oval with the round or circle. "How is the oval different from the round?" "It is longer." "What things do you know that are shaped like the oval?" "An egg, a basket, a bath-tub, a dish, etc."

The Sphere, Cylinder, Cube, Cone and Pyramid are solid figures. The cylinder can be explained from the sphere, the cone from the cylinder and the pyramid from the cube.

The pyramid points upward, so,
But it is square and flat below:
The cone is pointed, too, and round;
A sugar loaf like it is found.

The children soon learn the difference between the Cone and Pyramid, and if they are allowed to make all these solid figures in clay they will remember them more easily.

1. The oval shape is like an egg,
   The circle's round as all can tell,
   The sphere is round, just like a ball,
   The cylinder you know quite well;
2. We roll it gently on the ground,
   For it is very smooth and round;
   It has two faces flat, you see,
   And stands, as well as rolls for me.
3. The cube has six square faces, flat,
   And corners eight, just think of that!
   And edges twelve, three fours you know,
   Which round the faces always go.

The Pentagon, Hexagon, Octagon and other similar forms should be learned by drawing them on checkered slates or paper. These figures introduce the obtuse angle, and before the children learn the shapes, they should understand clearly the difference between the right, acute, and obtuse angles. The hexagon and octagon can be combined so as to make pretty designs which may be used for perforating and embroidery.

The "Forms" may be further impressed on the mind of the child by means of a Story; see the one given after "Color," at end of this chapter.

COLOR

Color should be taught if possible from objects and pictures. The six colors can be illustrated by fruits, as an orange, a rosy apple, a purple plum, a red cherry. The children's dresses, their eyes and hair, can all be brought into a lesson on color. In spring and summer flowers make charming illustrations, *e.g.*, different colors seen in roses, and the autumn-tinted leaves can be used likewise.

Then there are colors in pictures, trees, besides colored wools, beads, tablets, etc.

Ask for flowers and fruits of certain colors, *e.g.*, what flower is yellow? What fruit is red?, etc. Also colors of birds and animals, and let the children say what colors look nice together. In summer this may be shown by arranging a number of flowers in a bouquet.

In the flowers themselves colors always harmonize, *e.g.*, forget-me-not is blue, and has a yellow center, because blue and yellow look pretty together.

Spring flowers are mostly yellow, and have pale green leaves, for green and yellow look pretty together.

The red poppy and blue cornflower look pretty among the yellow corn, and there are yellow flowers among the corn also.

Harmony of color may be further illustrated by the dressing of a doll, or a story of a little girl who was taken to the shop by her mamma. The little girl was to have a new dress, cloak, and hood; what colors would her mamma choose?

Secondary Colors.—Teach that *red, blue* and *yellow* are the first or *primary* colors, from which other colors may be made. A child's box of paints and six small tumblers are required for the following illustration.

Pour a little water into each tumbler, and mix a little red paint in one, a little blue in the next, and a little yellow in the third. These are the primary colors.

Let us see what can be made by mixing *two* of them together. Take an empty tumbler. Pour in a little blue water and a little yellow. Mix together and the children will see that *green* is produced. Now take another tumbler and mix blue and red in it; this makes *purple.*

In another tumbler show that red and yellow make *orange.* "What beautiful thing have you seen in the sky showing all these colors?" "A Rainbow."

This is a most interesting lesson, and if the tumblers, etc., are not obtainable, the same experiment may be shown on a piece of white cardboard. Paint the colors in stripes on the cardboard, first the three primary, which should be allowed to stand; then the secondary are produced by rubbing one color over another, *e.g.*, paint over the red with blue, and purple is produced. Over the blue stripe paint a little yellow, and we have green. Over the yellow stripe paint red, and orange is seen.

The primary colors are Red, Yellow, Blue,
The Red and Blue mixed will show Purple to you;
Mix Yellow and Blue if you wish to make Green,
Mix Yellow and Red, then bright Orange is seen.

Color Story

After the forms and colors have been learned, they may be woven into an interesting story, thus:

"A man had a large piece of land to make into a garden; he gave a piece to each of his children, and said they might make small beds of any shape that they liked.

"So Johnnie made a *round* bed" (draw shape on board, and let children copy on slate), "and Willie had a *square* bed; Mary said her bed should be *oblong*, and Nellie made hers *oval*" (draw each on board, and let the children copy). "Then Gerty wanted hers to be the shape of a *semicircle*, and Harry said his should be very pretty, for he would make it *crescent* shape, like the moon."

When the blackboard is full of shapes the teacher might say: "Now you would like to know what these children had growing in their beds. Johnnie had a *pink* rose-bush in the middle of his bed.

"Willie sowed red Poppy seeds in rows in his square bed, and Mary had a yellow Iris in the center of hers, with blue Forget-me-nots all round. You remember that blue and yellow look pretty together."

Whenever possible, pin the flower named on the shape representing the flower bed.

The story should be continued until all the "beds" have flowers in them. The children may be allowed to suggest names of flowers and should be encouraged to choose colors that will harmonize.

THE STORY OF THE SPIDER AND THE BUTTERFLY

ON the garden wall a brown was spinning her Backwards and forwards she went, making hundreds of little threads at once, twisting them into white ropes, arranging them with her feet and the little hooks on her jaws, and gluing them together where they crossed.

The stood on a and watched.

"Is that to put your eggs in?" she asked at last. "Or do you put them on a cabbage?"

"On a cabbage! No, indeed!" said the , staring with all her eight eyes at once. "I make a soft nest of silken threads to put them in."

"That would not do for *my* babies." And the nodded her head and looked very wise. "They would get their wings fast in the threads."

"Their what?" gasped the , standing suddenly still in the middle of her .

"Their wings," repeated the innocent . "I don't think I dare let my children come to play with yours if you always hang about."

"But your children won't have wings!" gasped the again. "They won't be baby !"

The laughed gaily.

"What a funny idea!" she said. "Your eggs hatch into baby , don't they? and they don't have wings. And the hen's hatch into little baby , and they do have wings, like the hen. I saw them this morning running after her, with all their wings stretched out. I suppose they are not old enough to fly yet. When my babies can fly, I shall go back to the flower garden."

She flew away, leaving the astonished still sitting in the middle of her , trying to understand it all.

"Well!" she exclaimed to herself at last. "That's what comes of having no mother! I always did say that the family arrangements of the are the most foolish I ever heard of."

The was very busy, gumming her eggs safely underneath a cabbage leaf. Each little jar hung by its narrow end, as close to the next as could be.

"What a funny old !" she thought at last, when she had finished. "I wonder if she has finished that ."

"Have you found a cabbage to please you?" called the .

"Well, I suppose it's all right," answered the a little doubtfully. "I don't seem to be able to think of a better place to put my eggs, and I suppose the flowers will grow on the cabbage very soon. My baby will not be able to fly far at first to find honey."

"You mean your creepy, crawly !"

"Don't you mean ?" asked the , trying to be sarcastic.

"Nothing so sensible! If you want to see——"

"Hush! hush! Don't quarrel!" said the Breeze, shaking the 's , and puffing at the 's wings.

"She says that my babies will be creepy, crawly——"

"Come away! come away! Come and find some honey!" said the Breeze.

He shook the , and the fell off Then the Breeze so hurried her across the garden that when they reached the flowers she was out of breath with laughing.

"I suppose that old is jealous because her children will not be so pretty as my baby !" she said.

LADY GRAY AND THE NUTS

ONE summer Robert and his father and mother lived in a little in the woods.

They saw a running about in the .

Robert put some  on the ground, and hid behind a . Soon the came and carried them away.

The next day he put the nearer the . The came again and carried them away.

So it went on for some time. Each day Robert put the nearer the

They named the Lady Gray.

One day Robert's mother sat down on a in the porch. She put some on the floor and kept very still.

After a while Lady Gray came up on the porch. She looked at Robert's mother, then she took a and ran off as fast as she could.

By-and-by Lady Gray became so gentle that she would hunt for in their pockets.

One morning father put a on his shoulder. Lady Gray jumped on father's shoulder and ate the How they all laughed!

CUNNING NANCY AND HER KITTENS

THREE little were born in a where there were two lively

The were at once named Tom, Dick, and Harry.

As soon as they were big enough to handle, the began to carry them round, indoors and out. Nancy, the mamma , did not like her to be handled so much, for she knew it was not good for them. She mewed, but the children did not notice her distress.

Dick, a lovely grey, seemed to be her pet. She took the best care of him, and seemed most worried when the children picked him up.

One day little Dick could not be found. The hunted for him, but in vain. They noticed that Nancy did not seem anxious, nor did she go looking for her lost .

They did not notice, however, that she would often go up the , and stay away awhile from Tom and Harry.

When washing day came, they found out all about it. In a low, dark upstairs, where the soiled clothes were kept, Nancy and Dick were found. Dick was snugly wrapped in the clothes, and purred contentedly. Mamma Nancy lay beside him. She had taken her favorite and hidden him, so that the children should not play with him.

THE GOOD LITTLE STARS

ONCE upon a time a great many little lived up in the sky.

Their father was the , and their mother was the .

Usually these were good little . They liked to help brighten the sky and so make the brighter.

But one night when their mother called to them to come and light up the sky, they came very slowly. They looked very cross. They did not shine when she told them to do so.

Mother felt sad. She called up from the some good little . They were only on , but Mother changed them into in the sky.

The naughty felt themselves falling. Faster and faster they fell, until they sank down into the .

They cried and cried until they fell asleep, for they were very sorry for what they had done.

In the morning Father shone out so brightly that everything, even the baby under the grass, wakened. They began to cry again.

Their father felt sorry for them. He told them they might shine on the .

So now the stars shine in the sky at night, and in the morning, when Father shines for them, the open their eyes and shine in the grass all day.

THE PANIC IN THE FOREST

A timid hare was resting one day in a grove of palm-trees, and a strange thought came into his head.

"What should I do if an earthquake occurred?"

At that moment a gust of wind shook the palm-trees, and some ripe fruit pattered down.

"An earthquake is beginning!" cried the timorous hare. And, starting up, he fled without daring to look behind him. A deer met him as he was racing along.

"What is the matter?" said the deer, catching up with him and running by his side.

"An earthquake is destroying the forest!" the hare gasped out.

The terrible news quickly spread among the hares, deer and rabbits, and they scampered away in wild terror. As they went on, they were joined by elks, buffalos, elephants, tigers, and rhinoceroses.

"What is the matter?" said each animal in turn, as he joined the fugitives.

"An earthquake is destroying the forest!" they panted, rushing on, and never stopping to see if it were so. At last the line of frightened animals extended across the country for a full mile. All the smaller beasts standing in the path of the army of fugitives were unable to ask any question; they had to race ahead to avoid being trampled down.

But as the maddened host was sweeping blindly down to the bank of a great river, which looked like being choked up with dead bodies, a lion came up, and stopped the frightened beasts with a terrible roar.

"What is the matter?" he said to the tigers.

"The buffaloes told us that an earthquake is coming," said the tigers.

"Who saw it coming?" said the lion.

"We don't know," said the tigers. "The elephants know."

"The rhinoceroses told us," said the elephants.

"And we heard it from the buffaloes," said the rhinoceroses, panting for breath.

The buffaloes heard it from the elks; the elks heard it from the deer; and at last it got down to the timid hare.

"Do you mean to tell me," roared the lion, "that you have all been frightened to death by a timid little hare? Let us go to the grove of palm-trees, and witness this terrible earthquake."

When they arrived there, the fruit was still pattering to the ground.

"Now, you see," said the lion, "what comes of following the lead of the most timorous creature on earth. He has made you all more cowardly than he is himself. You ran away without even hearing the noise that frightened him. Henceforward avoid the gossip of the crowd, and trust to your own judgment.

THE JOURNEY FROM THE CLOUDS TO THE SEA

When the little drop of rain fell, he didn't know in the least what was going to happen. For a minute or two he felt quite frightened. Then he suddenly found himself rolling down a hill. He had just begun to think it great fun, when he noticed a lot of other drops beside him, all laughing together and all rolling down the hill.

One of them came close to him and touched him, and he found himself growing bigger. Then more and more came up, and presently he saw that he was quite a big fellow. He felt very proud of himself. "I'm getting bigger and bigger every minute," he said.

Half-way down the hill he looked back, and saw himself stretched out like a line of silver, glittering and shining between the trees and stones and bushes.

"I'm a stream now," he murmured proudly as he hurried over sand and gravel and clay, "and I'm getting bigger and bigger still."

Suddenly he found himself falling over a big black rock. Down, down he fell, thirty feet or more. But he was so big and strong now that he didn't care a bit.

At the bottom of the hill there were a great many rocks and stones right in front of him. "Get out of my way!" he roared. "I'm a river now! Get out of my way!" And he dashed and splashed and flew right over them.

A little farther on he came to a lovely meadow, with beautiful trees hanging down, and birds singing, and great sleepy red cattle standing knee-deep in the long, sweet grass, and the big blue sky shimmering overhead. It was so very, very pretty that he thought he would stay here a while. So he twisted and wound round and round, just to get another look at the trees, and to watch the birds flying from branch and bush.

He laughed merrily to a little boy who was standing on the bank with a fishing-rod in his hand, and hurried on again.

As he turned a corner quickly he saw a great blue plain stretching for miles and miles, with ships and boats and birds dotted here and there on its broad, heaving, shining surface.

"Hello! There is the sea at last!" he cried joyfully, and rushed forward eagerly to meet it. And as he joined the great ocean he shouted out as if he meant that all the world should hear, "Here I am; I'm a sea now!" (See full page illustration on page 68.)

THE SPIDER AND THE FLY

The spider was in a rare temper as she hurried back to the dark corner where she had her home.

"Upon my word," she muttered, "it is too bad! This is the third time that wretched housemaid has swept my web away. The ignorant creature calls me an insect. I am not an insect. My body is in two parts instead of three; my head is part of my chest; and I have eight legs instead of six."

The spider sat in her dark corner thinking very hard. Presently a buzzing sound caught her ears, which happened to be placed at the end of her feet. Her six pairs of eyes glistened with anger.

"There's that old bluebottle again," she murmured. "His noise makes my head ache. If I make haste and spin another web, perhaps I can catch him before the maid comes with her broom.

Having made up her mind, the spider began. On the underpart of her body were four tiny tubes, each with about a thousand still tinier holes. From each tube came a thousand delicate threads made of a gummy fluid. The spider's hind feet combed and twisted them into one fine thread.

The thread gradually increased in length until a draught caught it and carried it to the edge of the window-curtain, to which it clung.

Several other threads were then stretched from point to point.

"Now," said the spider, "I can go on building my web."

Line after line appeared as if by magic. The lines crossed and recrossed, and at every point where they touched a tiny drop of sticky fluid held them firmly together.

The spider viewed her work with satisfaction.

Lastly, she ran a more delicate thread round and round in spiral fashion. At

the end of an hour the web was complete.

"Now I will test it," said the spider; and she tried her work here and there, and found it quite good.

Only a short time passed before the big fly buzzed into the elastic strands. The more he struggled, the more he became entangled.

The spider was hungry and very impatient. She darted from her lair and seized the fly with her terrible claws.

At the end of the feelers were tubes from which she poured poison into the body of her prisoner, while with her fore feet she entangled still further the fly's legs and wings.

In a few moments the bluebottle was quite still. Securely bound up in the sticky strands, bitten and poisoned, it was clear that he would never again buzz about in the sunshine. Then the spider enjoyed a better meal than she had had for a long time.

An hour later the housemaid came along, and, catching sight of the web, she flicked it with her duster.

"That miserable insect has been at its tricks again," she said.

The spider was just settling down to a quiet nap after her hearty meal. She did not like being disturbed, but it did not matter so much now. She simply smiled to herself. (See articles on Spiders; Flies and Insects in general in Book of the Animal Kingdom.)

THE STORY OF PETER PAN

Every child in the world grows up to be a woman or a man. The only one who doesn't grow up, and won't, is Peter Pan. He always stays a little boy, which is very jolly indeed, and he's friends with all little boys and girls,—as you'll understand if you read.

The Darlings,—Wendy, John, and Michael,—lived with their father and mother. They were rather poor, but it didn't matter, they were all so fond of each other. They'd a little maid called 'Liza, and, because they hadn't the the money for a proper nurse, they'd a dog instead, named Nana,—wasn't it funny?

Peter Pan came every night; the window blew open wide, and in he hopped, without a sound, and hurried to Wendy's side. And a curious little dancing light came in with Peter as well; this was a fairy lady, and her name was Tinker Bell. Peter was dressed in skeleton leaves; he had pipes on which he played—a delightful person. Wendy was not the least little bit afraid. He talked to her of the Never-Land, where she'd always wanted to go. And he said, "If I only teach you to fly, you can get there now, you know!" So John and Michael were taught to fly, and Wendy too, and they found it's as easy, when you get used to it, as walking on the ground. And at last, when both their father and mother were out, one Friday night, the Darling children and Peter Pan and Tinker Bell took flight. Away in their little nightgowns they flew, as fast as they could go, till they came to the island, the Never-Land, where all the adventures grow.

Now in this island, I must tell you, were wonderful things to find: unknown birds, and curious beasts, and Redskins, fierce but kind. Fairies were there, and Mermaids, and Wolves,—some wild, some tame; and a Crocodile that had swallowed a clock, and ticked wherever it came. But—hush, let us whisper!—the "Jolly Roger," a rascally pirate craft, with raking masts, and swelling sails, and guns both fore and aft, was anchored there, and the hideous crew were lying in wait, each man, and the captain, Hook, in particular, to kill little Peter Pan. Hook was not his real name; Peter, some while ago, in open fight, had cut off his hand, so now he'd a hook, you know. And as, with a stern and gloomy air, he paced, on his quarter-deck, he was thinking all the time, "I'd like to wring that Peter's neck!" And the rest of the horrible band of Pirates were always prowling about, to see if they couldn't capture Peter, and kill him, without a doubt. They crept along, singing "Yeo-ho-ho"—as stealthily as could be, they, and the bo'sum, who, indeed, was the best of them—one Smee. But the Redskins, with the tomahawks, were on the Pirates' track, and followed them quite noiselessly,—not a single

PETER PAN, WHO COULD NEVER GROW UP TO BE A MAN

rustle or crack. For they thought the world of Peter Pan; in fact, they all were rather inclined to kneel at his little feet. And they called him "Great White Father."

Upon the island there were also some boys—well, counting rightly, there were six: Nibs, Tootles, Curly, and the Twins (no names), and Slightly. And Tootles, by a silly mistake, when he saw the Darlings near, hastily aimed his swiftest arrow, and drew his bow to his ear, and shot poor Wendy. Just at first she was thought to be dead, by her friends. But, finding she wasn't, they built her a house, in the hope of making amends. They built it right, round her, with branches, leaves, and moss, and lovely make-believe roses clambering quite across. And when it was com-

pleted (and it looked remarkably fine), "Oh, Wendy, do be our mother!" they cried, and they hadn't to ask her twice. "Come in at once, you naughty children!" Wendy delightedly cried; and they all squeezed in, except Peter Pan, who stayed upon guard outside.

There was also a beautiful house under-ground, where elegant mushrooms grew, and a Never-tree also (but every morning they sawed the trunk right through). You entered the house by hollow trees, going up and down quite fast, which was hard at first, but the children did it exceedingly well at last. And here, in the charming underground house, the eight boys slept alone in a great big bed,—for Wendy lived in that dear little house of her own. But every evening she told them stories, and when the stories were done, they'd have a dance in their night-clothes, and a pillow fight,—Oh, such fun! Peter Pan wasn't always there, because, as you understand, he was busy strolling about the island, or watching with sword in hand. But in the day-time he would come, and take them, not very far, to the blue lagoon, where the weedy rocks and the hundreds of Mermaids are.

And here, one day, both Peter and Wendy received a bit of a shock; for Hook pursued them, and so they climbed on a rock—the Marooners' Rock. Wendy fainted, and so did Peter. A Mermaid came to see whoever those two little dripping folks on the slippery rock could be. Then Peter perceived the tide was rising, and he tied up Wendy tight to the tail of a kite which was drifting near, and sent her away with the kite. And there he stayed on the rock alone, and he thought he'd be drowned each minute. But the Never-Bird, in her floating nest, came up, and Peter got in it, while the Never-Bird took to a Pirate's hat, which was luckily close at hand. So Peter went gaily sailing off, and arrived quite safe at land.

Now every night the Redskins were camped above the underground house. And every night the Pirates were creeping, each as still as a mouse (with the terrible Crocodile after them, showing its crunching teeth), while Wendy was cheerfully telling tales to the children down beneath. But, oh dear me! there came a night when that treacherous pirate Hook contrived to surprise the Redskins, and the children; and he took the whole nine children prisoners, exceedingly sad to tell. The only ones who made their escape were Peter and Tinker Bell. And while the unhappy children were roughly carried on board, Peter was off to rescue them, with his trusty dagger and sword. And, just in the nick of time, he arrived. He armed the boys, and they slew, after a most tremendous fight, fifteen of the Pirate crew. And after a thrilling duel, which lasted a very short while, between Hook and Peter, the wicked Hook was thrown to the Crocodile.

So Peter took command of the ship, and they all sailed home, and then, how glad their father and mother were, to have them back again! They all were dressed in the Pirates' clothes (cut short), and exceedingly grand; and oh, what tales they had to tell of the wonderful Never-Land! Peter, who didn't like houses at all,—brick ones, and that sort of thing, returned to the Never-Land by himself. But he comes back every spring, and fetches Wendy to help him do spring-cleaning, and Wendy stops and tidies up the little house, which is now in the high tree-tops. As for the boys, they've all grown up, so the Pirates' clothes won't fit. And as for the great adventures they had, they've forgotten them every bit. Only Wendy and Peter Pan can still do just as they please. How happy they are, as they talk up there in the dear little house in the trees!

COUNTING AND NUMBERS

In numbers, as in other primary subjects, a child should be *taught* and *permitted* to do things himself. Rousseau said, "What the child *does*, it easily remembers"; and we shall soon find that time spent in this way is far from being wasted.

Children who have been taught numbers gradually, in this easy, interesting fashion, develop an astonishing aptitude for dealing with figures as they grow older.

Counting

Learning to count 1, 2, 3, 4, etc., parrotlike, does very little good. Rather let the child count *objects* and point out 5 marbles, 6 blocks, etc., in order that you may determine if he knows exactly what 5 or 6 of anything means.

Take a number of blocks or marbles and ask the child to take 3, 5, 7, or any number of them.

Hold up 3, 5, or 6 of them and ask him to tell how many you have. When you are told the *number* you have, write the *figure* which tells the number on paper, or the blackboard. Have the child copy the figure, making a large character.

Then reverse the work by writing a *figure* on paper and asking the child to take the *number of blocks* the writing asks for.

Spend a few minutes every day in asking him to show you 2 pins, 3 houses, 5 stripes, etc.

Teach the child to count 50 as soon as he has started in his number work at school and later on to 100. *Objects* should be counted at first and then counters substituted, such as pennies, marbles, blocks, beads, etc.

Recognition of Numbers.—The purpose of *counting objects* is to give the children a clear idea of *number*. They should be able to recognize 2, 3, 4 and 5, *i.e.*, be able to tell four objects when they see four, without counting them, also 3, 5, etc. Stories and games with objects should be repeated again and again, until the children can do this easily.

Analysis of Numbers.—When the numbers can be recognized without difficulty, the children should be encouraged to analyze them, *i.e.*, tell what they are made up of, but objects should be put in front of the class to represent the numbers until they can do this readily.

Suppose the number *five* to be the lesson, each child would take five shells out of its box, and lay them on the desk, thus:—: :· or ⁝ : or :· : etc. The child should always be able to *describe* what it has done: thus, the first child would say—*four shells* and *one shell* are *five*; the second, *three shells* and *two shells* are *five*, and so on.

Higher Numbers.—The analysis of six, seven, eight and nine may be taught in the same way, each number being taken separately and thoroughly mastered, before proceeding to the next. The children should learn all the different combinations of numbers that make six—*three* and *three*, *five* and *one*, *four* and *two*, *three twos*, etc.—but always with the objects, and when they have seen the number analyzed by the Teacher, they should do it for themselves with shells, bricks or other objects.

Number Ten.—This is the most important number of all, and it should be thoroughly well taught. The Teacher should show on the table the different analyses that can be made of ten, and the children should lay these with shells or other objects again and again. It is necessary to learn these perfectly, for however well any or all of the numbers may be learned, they are comparatively useless without ten.

Figures.—When the figures are introduced they should invariably be shown with the concrete numbers which each figure represents. They say, "Here are four balls" : : "I will show you a figure that means those four balls, **4**, and I will put the four balls beside it, thus:"—4 : :

Number on Paper or Slates.—If the children have learned how to use a pencil, they may transfer the number-pictures made with shells to their slates, using dots for "shells," thus:— : : :

Then another "picture" may be made with the shells : : : and this be copied on the paper at some distance from the other. Then another is made and copied, and so on until the child sees on his paper all the combinations of numbers that go to make six. He should be able to read them all out, and because a child remem-

bers what he has done himself, it will be found that numbers taught in this way are seldom forgotten.

As the children become more proficient, the two signs + and = may be taught, + means *and*, = means *are*. Then they may put on their slates : + : = : : and use these signs in the analysis of other numbers.

Money Taught as Numbers

When the children know numbers up to ten, they might play little "shopping" games with coins. Show them actual coins in teaching money. Lessons on money should be given frequently after the first year of school life.

Begin by teaching the value of the *cent* and the *nickel*, then the *dime*, then the *quarter*, then the *half-dollar*, and then the *dollar*.

Make little problems involving change. Develop the ability to make change rapidly. The child may have some money of his own and he should be taught the comparative values of the coins.

Simple Table of Money

10 cents make 1 dime.
2 five-cent pieces make 1 dime.
100 cents make 1 dollar.
A quarter of a dollar = 25 cents.
A half-dollar = 50 cents.
$ means dollars and c means cents.
A 5-cent piece is called a nickel, because it is made of nickel.
A cent piece is made of copper.
The other coins named are made of silver.
(See United States Money for more advanced instruction.)

COMBINATIONS OF NUMBERS

We now come to the method of teaching the combinations in Addition and Subtraction.

We can count books, tables, and houses and say that we have counted so many *things* but we do not *add* books, tables, and houses. We *add* books and books, tables and tables, houses and houses.

We count by *ones*. When we add three beads and two beads we are counting by ones, for it means that we are adding three ones of beads and two ones of beads, making five beads in all.

From **1** to **9** we use only one figure to tell how many we mean. When we wish to say in writing that we have ten of anything we write a **0** after the **1** and **have 10,** ten.

1. Add 1 to every number up to 10; later to 20.

2. Subtract 1 from every number up to 10; later to 20.

3. Add:

2	3	4	5	6	7	8	9	10
+2	+3	+4	+5	+6	+7	+8	+9	+10

Here the addends are equal and easily added. The figures should be placed as above and not 2+2, 3+3, etc., because the vertical form is the natural one which the child will use all through life. It does not look so formal and represents better what he really does with the objects.

4. Add:

1	2	3	4	5	6	7	8	9
+2	+3	+4	+5	+6	+7	+8	+9	+10

Here one addend exceeds the other by 1.

5. Subtract:

2	3	4	5	6	7	8	9	10
−1	−2	−3	−4	−5	−6	−7	−8	− 9

Here the minuend is one greater in each case.

6. Teach the parts of 10.

5	2	3	4	9
+5	+8	+7	+6	+1

7. In adding 9 to numbers have the child think of 9 as 10,

thus $9 + 6 = 10 + 5$ and $9 + 8 = 10 + 7$

8. Teach the corresponding subtractions.
9. Add 8 to each number up to 10.
10. Teach the corresponding subtractions.
11. Add 7, 6, and 5 to each number up to 10.
12. Teach the corresponding subtractions.
13. Review and give combinations not taught above.

Objects should be grouped by tens and units, in showing numbers above *ten*. Ten should be the basis of all our reckoning, and if the children know ten, and the numbers which precede it, they can soon be taught the rest. Little children should not have "sums" given them to do on their slates, for "sums" are made up of *abstract* figures, and children of tender years cannot grasp the abstract.

Number to One Hundred.—When the children are conversant with numbers up to ten, it is very easy to teach them one hundred.

PRIMARY IDEAS OF DIVISION

In teaching the two ideas of division—division by *measurement* (division proper) and the *fractional* idea of division (partition)—proceed very slowly and see that each step is thoroughly understood.

The following suggestions may be useful:—

Division by Measurement

Use blocks or any other counters in illustrating the process.

Example:

$4 \overline{)12}$

The teacher should ask the child, "How would you count this story?"

Facts Given by Child

12 = whole number of blocks.
4 = number in each part.
We want to know the number of parts.
We place the blocks so, 4 in each part:—

□□□□ □□□□ □□□□

There are 3 parts.

DIVISION BY PARTITION

Make use of blocks or substitutes to show the process here.

EXAMPLE: ¼ of 12 = 3.

The teacher should ask the child, "How would you count this story?"

Facts Given by Child

12 = whole number of blocks.
4 = number of parts.
We want to know the number in each part.
We place the blocks so, as we know there are 4 parts:—

□ □ □ □

We have put one in each part.
Now we will put one in each part until the 12 blocks are gone:—

□□□ □□□ □□□ □□□

There are 3 in each part.

NUMBERS IN MULTIPLICATION

EXAMPLE:

$3 \times 4 = —$

Facts Given by Child

3 × 4 means 3 4's.
I count my blocks by fours—I take 1 four, another, another.
I find that 3 4's are 12.
$3 \times 4 = 12$.

To the Teacher:

Now the child is ready to give a number story about 3 × 4.

PRIMARY MEASURES FOR CHILDREN

The child has been taught to count. Now while he is telling you *how many* objects he is dealing with, teach him to tell *how much* he is dealing with.

In other words, have the child *measure and compare* as well as count.

Ideas of larger and smaller, longer and shorter, and the like, should be made important. The need at the outset, is to learn, in a simple way, the basis of all arithmetic—the *comparison* of *quantity*, —in as many of its forms as possible.

MEASURES OF LENGTH

Teach the child to estimate distances and then to verify every estimate by actual measurement.

Teach half inches as well as inches.

Long measure is used to measure length.

12 inches make 1 foot.
3 feet make 1 yard.
in. means inch or inches.
ft. means foot or feet.

For the Child to Do:

1. Cut a strip of paper 12 inches long and 1 inch wide.
2. Mark the inches on it.
3. How many inches long is it?
4. What do you call a measure 12 inches long?
5. Draw a line 2 inches long, as near as you can, without using a ruler.
6. Measure it with a ruler. Did you guess nearly right? Try again.
7. Measure this page. How long is it? How wide?
8. Draw a line on the ground 1 yard long.
9. ½ of a foot is how many inches?
10. 1 yard is how many inches? What is measured by the yard?
11. Ask your mother how many yards of cloth she needs for a dress.
12. What is measured by the foot?
13. How tall are you?

TELLING THE TIME

First—Teach him to tell the hour hand from the minute hand.

Next—Teach him when he first looks at the dial, to find the hour hand and then notice which Roman Numeral it is nearest. *This will tell about what time it is.*

Then—Find the minute hand. *The minute hand will tell exactly what time it is.*

TO ILLUSTRATE: Take this clock. The hour hand is near the Roman Numeral II., which stands for 2. Tell the child it is somewhere near two o'clock.

The minute hand will tell how near.

What time is it?

It must always point to the XII. before it is exactly the hour. If it is one numeral away

from the XII., toward the left, it is 5 minutes of two. If it is two numerals away to the left it is 10 minutes of two, etc. If it is one numeral away to the right, it is 5 minutes after two, etc. Proceed in this way and keep at it.

The Day

A new day begins at midnight and lasts until the next midnight.

Midnight is the middle of the night; that is, 12 o'clock at night.

Noon is the middle of the day, that is, 12 o'clock in day time.

One hour after noon is 1 o'clock, 2 hours after is 2 o'clock, etc.

If a person says he was at a certain place at 2 o'clock, he must say forenoon or afternoon, so we will know which half of the day he means. If it was 2 o'clock in the morning he would write 2 A.M., and if 2 o'clock in the afternoon, 2 P.M.

Things for the Child to Do:

1. Name the days of the week and the months of the year.
2. What day of the week does Christmas fall on this year?
3. Is 22 days longer than 3 weeks?
4. Is 5 weeks longer than a month? How much?
5. How many days in 3 weeks?
6. On what day of the week will your next birthday be, etc.

Remember:

The days of the week in their order.

The months of the year in their order.

Procure a calendar for the child to own.

A good way to make him familiar with the use of the days of the week and month, as found on a calendar, is to ask him to look up and tell on what day of the week the next Fourth of July will fall; Christmas; New Year; his birthday.

Have him distinguish between the day of the week and the day of the month.

7 days make 1 week.
30 days make 1 month.

Days of the Week	Months of the Year
Sunday	March
Monday	April
Tuesday	May
Wednesday	June
Thursday	July
Friday	August
Saturday	September
Months of the Year	October
January	November
February	December

THE CALENDAR

1903 July 1903						
Sun.	Mon.	Tues.	Wed.	Thur.	Fri.	Sat.
First Quar. 1st 30th	Full Moon 9th	Last Quar. 17th	1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	New Moon 23d

ELEMENTARY APPLICATION OF NUMBERS

READING NUMBERS

When we spell a *word*, that is, when we read the letters in the word, we read from *left* to *right*.

To read a *number* we do the same thing, for we read the figures from left to right.

325 is read "three hundred twenty-five."

The number is read differently if we wish to tell the *place* and *value* of a certain figure, for then we read the figures themselves from *right* to *left*, thus:—

325 means 5 units, 2 tens, 3 hundreds.

Never use "AND" in reading whole numbers.

325 should never be read "three hundred and twenty-five," but "three hundred twenty-five."

Numbers between 100 and 1000 are read by naming the hundreds, tens, and units in succession. Thus—

192—one hundred ninety-two.
652—six hundred fifty-two.
207—two hundred seven.

Above 1000

Read 1,892,632.

Here the 2 represents 1's, or units of the first order.
the 3 represents 10's, or units of the second order.
the 6 represents 100's, or units of the third order.
the 2 represents 1000's, or units of the fourth order.
the 8 represents 100000's, or units of the sixth order, etc., etc.

The order of any figure is the number of its place, starting from the right.

In reading large numbers we arrange the orders into groups of three figures each.

We call each group a period. Commas are used to keep the periods separate.

Names of the Periods

units, billions, quintillions, octillions,
thousands, trillions, sextillions, nonillions,
millions, quadrillions, septillions, decillions.

trillions	billions	millions	thousands	units
225,	902,	302,	472,	399

FUNDAMENTAL OPERATIONS

Addition is the method for finding a number equal to two or more numbers taken together. The result of adding two or more numbers is called their *sum*.

The sign +, called plus, written between two numbers, denotes that they are to be added together.

The sign = is an abbreviation for "is equal to" or "equals."

EXAMPLE: Add together 1097; 48214; 34; 7916. We first add the units, 7+4+4+6=21, *i. e.* 2 tens+1. We carry—*i.e.* include—these 2 tens with the tens in the given numbers; thus 2+9+1+3+1=16 tens, =1 hundred+6 tens. Carry this 1 hundred, and add it with hundreds, and so on. It is convenient to write down the given numbers under one another so that units come under units, tens under tens, and so on—drawing a line under the last number.

Thus:

1097	Say, mentally,
48214	6, 10, 14, 21; carry 2,
34	3, 6, 7, 16; carry 1,
7916	10, 12; carry 1,
57261 *Ans.*	8, 16, 17; carry 1.
	5

FACTS ABOUT ROMAN NUMERALS

The following facts about the origin and development of Roman notation can be made very interesting, and will tend to fix the characters in one's mind—

At first one	was written.....I
two	was written.....II
three	was written.....III
four	was written.....IIII
five	was written.....IIIII
six	was written.....IIIIII
seven	was written.....IIIIIII
eight	was written.....IIIIIIII
nine	was written.....IIIIIIIII

It took too long to make ten marks, and too long to count them after they were made, so one mark with another across it was used to denote 10, thus X. The upper or first half of the X, or V, was used to show 5.

At first twenty	was written.....XX
thirty	was written.....XXX
forty	was written.....XXXX
ninety	was written....XXXXXXXXX

It took too long to make the crosses and too long to count them in reading, so Ɔ was used to show 100. Half of the Ɔ, or L was used to show 50. The Ɔ gradually became C in trying to make the Ɔ rapidly.

Write these where they can be seen plainly:

I= 1	XX=20	XXXIX=39
II= 2	XXI=21	XL=40
III= 3	XXII=22	XLI=41
IV= 4	XXIII=23	XLII=42
V= 5	XXIV=24	XLIII=43
VI= 6	XXV=25	XLIV=44
VII= 7	XXVI=26	XLV=45
VIII= 8	XXVII=27	XLVI=46
IX= 9	XXVIII=28	XLVII=47
X=10	XXIX=29	XLVIII=48
XI=11	XXX=30	XLIX=49
XII=12	XXXI=31	L=50
XIII=13	XXXII=32	LX=60
XIV=14	XXXIII=33	LXX=70
XV=15	XXXIV=34	LXXX=80
XVI=16	XXXV=35	XC=90
XVII=17	XXXVI=36	C=100
XVIII=18	XXXVII=37	
XIX=19	XXXVIII=38	

ELEMENTARY PRACTICE IN ADDITION

The following plan is suggested for learning the combinations in addition:—

1. Add 1 to every number up to 10; later to 20.

2. Add:

2	3	4	5	6	7	8	9	10
+2	+3	+4	+5	+6	+7	+8	+9	+10

Here the addends are equal and easily added. The figures should be placed as above and not 2+2, 3+3, etc., because the vertical form is the natural one which we use all through life.

3. Add:

1	2	3	4	5	6	7	8	9
+2	+3	+4	+5	+6	+7	+8	+9	+10

Here one addend exceeds the other by 1.

4. Learn the parts of 10.

5	2	3	4	9
+5	+8	+7	+6	+1

5. In adding 9 to numbers think of 9 as 10.

9	10	9	10

thus +6=+ 5 and +8=+ 7

6. Add 8 to each number up to 10.

7. Add 7, 6, and 5 to each number up to 10.

8. Review and form combinations not given above.

Note.—Objects should be grouped by tens and units, in showing numbers above 10. The numbers written should represent objects counted.

THE FORTY-FIVE FACTS OF ADDITION

1	2	2	3	3	4	3	4	5
1	1	2	1	2	1	3	2	1
2	3	4	4	5	5	6	6	6
4	5	6	4	5	6	7	5	6
3	2	1	4	3	2	1	4	3
7	7	7	8	8	8	8	9	9
7	8	5	6	7	8	9	6	7
2	1	5	4	3	2	1	5	4
9	9	10	10	10	10	10	11	11
8	9	6	7	8	9	7	8	9
3	2	6	5	4	3	6	5	4
11	11	12	12	12	12	13	13	13
7	8	9	8	9	8	9	9	9
7	6	5	7	6	8	7	8	9
14	14	14	15	15	16	16	17	18

Note.—Be sure that the nine facts underscored are thoroughly learned. They give most trouble.

RAPID ADDITION MADE EASY

Every business has more or less to do with figures. It is very important, then, that we should be accurate and rapid in *addition*. One small error in footing up an account may throw the total out several hundred dollars. Let accuracy be the first consideration, then drill, drill, drill, until you can add rapidly. Rapid adders are usually the most accurate. Note the following suggestions:—

Write the numbers in vertical lines. Irregularity in placing of figures is the cause of many errors.

Think of results, and not of the numbers themselves. Thus, do not say, 4 and 5 are 9, and 6 are 15, and 7 are 22, etc.; but, 9, 15, 22, etc.

Make combinations of 10, or other numbers, as often as possible, and add them as single numbers. Thus, in adding 9 34 73 214 9 54 82 123, say, 9, 16, 26, 33, 42, 51, 61, 67, taking each group, at a glance, as a single number. Where a figure is repeated several times, multiply instead of adding.

In adding horizontally, begin at the left, since the eye is more accustomed to moving from left to right than from right to left.

In adding long columns, prove the work, by adding each column separately in the opposite direction, before adding the next column.

When numbers are in regular arithmetical order—as 3, 4, 5, 6, 7, or 2, 4, 6, 8, 10, or 5, 10, 15, 20, etc.—to find their sum, add the first and last, take half, and multiply by the number or numbers. The half-sum represents the middle or average number.

TEST EXERCISE

Note.—Business men, and accountants, find it necessary to be able to add readily amounts when placed in a horizontal position, as well as when placed in a vertical position. In the following exercise, add both ways, and then prove the work by adding the results.

$246.00 +	$1024.60 +	$24.31 +	$3.72 =	**** **
39.85 +	319.24 +	63.84 +	4.96 =	**** **
412.40 +	2108.50 +	.03 +	2.12 =	**** **
31.60 +	316.42 +	2.41 +	3.24 =	**** **
*** **+	**** **+	** **+	* **=	**** **

CIVIL SERVICE METHOD OF ADDING

Employes under the civil service bureau, bank clerks, and others who perform additions while surrounded by people engaged in conversation, use the following method.

This method is safe because one can detect and change an error very quickly.

$5280	16
9760.50	21
349	19
4006.75	23
6522.89	18
132.12	24
	$26,051.26

THE BANKERS' METHOD OF ADDING

This method is the same as that used by the civil service employes, with one change. In adding the columns the number carried is "added in" to each partial sum.

$5280	*16*
9760.50	*22*
349	*21*
4006.75	*25*
6522.89	*20*
132.12	*26*
	$26,051.26

The banker's method is an improvement on the civil service method as it does not require a second addition. The number to be carried is always in sight in the bankers' method, being the tens figure of the last partial sum written. The sum can be written at once.

To prove addition.—Add the columns in opposite directions.

Subtraction is the method for finding what number is left when a given number is taken away from a larger given number.

The result of subtracting one number from another is called their difference.

Plainly the difference between two numbers is the number which must be added to the smaller to make it equal the greater.

The sign −, called minus, written between two numbers, denotes that the second is to be subtracted from the first.

EXAMPLE: Subtract 1287 from 40529.

We have to find the number which, when added to 1287, will make 40529.

Write the smaller number under the larger, with the unit's figure under the unit's figure, etc., as in addition. Then, 2 added to 7, make 9. Put down 2. Next, 4 tens added to 8 tens make 12 tens. Put down 4, and carry 1 (*i.e.* 1 hundred). In this step we have made the eighty in the smaller number up to one hundred and twenty, and this one hundred is added to the 2 hundred in the smaller number. Hence, in the next step, we say 2 hundreds added to 3 hundreds make 5 hundreds. Put down 2. Next, 9 thousands added to 1 thousand make 10 thousands. Put down 9 and carry 1. Finally, 3 ten-thousands added to 1 ten-thousand, make 4 ten-thousands. Put down 3.

Thus:	Say, mentally,
40529	7 and 2 make 9,
1287	8 and 4 make 12, carry 1,
	3 and 2 make 5,
39242 *Ans.*	1 and 9 make 10, carry 1,
	1 and 3 make 4.

By using the above method for subtraction it becomes a very simple matter to subtract the sum of several given numbers from another given number (greater, of course, than that sum). The student will see the importance of making himself thoroughly familiar with this method when he gets to "long division."

EXAMPLE: Subtract the sum of 1092, 20875, and 435, from 50171.

Put the figures down exactly as in addition, putting the 50171 first, and separating it by a line from the numbers below. Add the three lowest digits in each column, and make the sum up to the top line.

50171	Say, mentally,
	5, 10, 12, and 9 make 21, carry 2,
1092	5, 12, 21, and 6 make 27, carry 2,
20875	6, 14, and 7 make 21, carry 2,
435	3 and 7 make 10, carry 1,
	3 and 2 make 5.
27769 *Ans.*	

ELEMENTARY PRACTICE IN SUBTRACTION

The differences of all these combinations should be learned so thoroughly that it will be easy to name the difference of any combination on sight. This will take time, but it is time well spent.

Use devices similar to those used in the drills on the addition table. Make many problems and give the difference in each case.

COMBINATIONS IN SUBTRACTION

1	2	3	4	5	6	7	8	9	10
−1	−1	−1	−1	−1	−1	−1	−1	−1	−1
—	—	—	—	—	—	—	—	—	—

—	—	—	—	—	—	—	—	—	—	—

The Computers' Method

In making change the method below is nearly always used. Computers find it the more practical way. It gives greater rapidity and accuracy than the other method.

Many use it alone in teaching subtraction.

This plan is called the Austrian method by some.

Example: Find the difference between 725 and 432.

Work:	Explanation: Let the learner imagine
725	he is adding with the sum written above.
—	He inserts the missing figures to form
432	the sum as he works, 3, 9, 2. He thinks
293	of 2 and 3 as 5; 3 and 9 as 12; 5 and 2
—	as 7. He may talk it this way: 3 and 2,
	5; 9 and 3, 12; 3 and 4, 7.

Use that method with these examples:—

42,936	2034	7825	6243
−17,245	−1456	−1504	−1428
25,691	578	6321	4815

Note.—With practice the learner will come to prefer this method and should be helped in its use. It is practical, since conducive to both rapidity and accuracy.

How to Make Change

Salesmen usually *make change* by a combination of addition and subtraction. They have the money to count out, and in doing so they add to the amount of the purchase until they reach the amount of the bill presented. For example, if you buy something worth $3.35 and present a ten-dollar bill in payment, you will probably receive in return 5 cents, 10 cents, 50 cents, $1, and $5; the salesman saying 40, 50, $4, $5, $10. This method is least liable to error.

Accuracy and rapidity in counting out change can best be acquired by practice behind the counter or at the cash-desk. In the exercises immediately below, the amount of the purchase and the amount of the bills presented are given, and it is required to find the amount of change to be returned. Do the work without pen or pencil.

Exercises

1. $10.00 − $3.14
2. $15.00 − $2.13.
3. $30.00 − $9.94.
4. $10.00 − $7.16.
5. $20.00 − $2.95.
6. $5.00 — $1.90.
7. $1.00 − $0.45.
8. $2.00 − $1.20.
9. $2.00 − $1.03.
10. $7.00 − $5.19.
11. $40.00 − $23.18.
12. $25.00 − $15.65.
13. $20.00 − $13.21.
14. $15.00 − $11.15.
15. $50.00 − $22.68.

Proofs of Subtraction

To prove a subtraction add the subtrahend to the remainder. The result will be the minuend if the work is correct.

Example	Proof
425 minuend	173
—173 subtrahend	252
252 remainder	425

425 is the same as the minuend, hence the work is correct.

Another Proof

Take the remainder from the minuend. If the work is co rect the subtrahend will be left.

If in the last example given we write

425
—252

we get 173, which is the subtrahend used above, hence the work is correct.

Note.—Either proof may be used. Show why these two proofs are true. Use small numbers to do this, like 7—2. Later use larger ones.

Multiplication is the method for finding the sum of a given number of repetitions of a number. Thus 12 multiplied by 5 means 12+12+12+12+12, *i. e.* 60.

The number which is multiplied is called the multiplicand, and the other number is called the multiplier. The result is called the product. The multiplier and multiplicand are called factors of the product, and the product is called a multiple of either of these factors.

The sign of multiplication is ×. Thus, 12 multiplied by 5 is written 12×5, and is read "12 times 5."

In forming the product of two numbers, it is immaterial which number is taken for the multiplier. For instance, in the product 4×5, if we make 4 the multiplier, the result is 5+5+5+5, *i.e.* 20; while, if we make 5 the multiplier, the result is 4+4+4+4+4, *i.e.* 20, as before.

It is now necessary to make a Multiplication Table, *i. e.* a list of the results of multiplying all the numbers from 1 to 12 by every number from 1 to 12.

Multiplication Table

1	2	3	4	5	6	7	8	9	10	11	12
2	4	6	8	10	12	14	16	18	20	22	24
3	6	9	12	15	18	21	24	27	30	33	36
4	8	12	16	20	24	28	32	36	40	44	48
5	10	15	20	25	30	35	40	45	50	55	60
6	12	18	24	30	36	42	48	54	60	66	72
7	14	21	28	35	42	49	56	63	70	77	84
8	16	24	32	40	48	56	64	72	80	88	96
9	18	27	36	45	54	63	72	81	90	99	108
10	20	30	40	50	60	70	80	90	100	110	120
11	22	33	44	55	66	77	88	99	110	121	132
12	24	36	48	60	72	84	96	108	120	132	144

The first column consists of the numbers 1 to 12. The second column is obtained by adding each number to itself, and therefore represents the result of multiplying the first column by 2. The third column is obtained by adding the second to the first, and therefore gives the result of multiplying the first column by 3. The fourth column is obtained by adding the third to the first, and so on.

Elementary Drills in Multiplication

It is absolutely necessary to know this table thoroughly in order to make any progress at all in Arithmetic. Anyone should be able to give each table forward and backward in from thirty to forty seconds. No one who cannot do this should be allowed to think that he has mastered this table:

First count by 1's; 2's; 4's and 3's.

Remember that multiplication is a short method of adding.

Explanation of methods of multiplying by one or more figures.

EXAMPLE 1: Multiply 4507 by 6.

Here we have to find the result of repeating the number 4507 six times and adding. We first take six times the units' figure, then six times the tens' figure, then six times the hundreds, then six times the thousands, and add the results together. The process is abbreviated thus:

4507	Say, mentally,
6	six 7's, 42, carry 4,
	six 0's, 0, and 4,
27042 *Ans.*	six 5's, 30, carry 3,
	six 4's, 24 and 3, 27.

EXAMPLE 2: Multiply 5287 by 578.

Here we find 500 times 5287, 70 times 5287, and 8 times 5287, and add the results.

Thus:

5287	EXPLANATION.—Place the multiplier
578	so that its unit's figure comes under the
	unit's figure of the multiplicand. By
*26435	exactly the same process as in Example 1,
*37009	we find that 5 times 5287 = 26435.
42296	Therefore 500 times 5287 = 2643500
	(since each digit now has 100 times its
3055886 *Ans.*	former value). Next we find 7 times
	5287 = 37009, and therefore 70 times 5287
	= 370090. Finally, 8 times 5287 = 42296.

*Note that it is unnecessary to affix the ciphers in the separate products, since the position of each digit indicates its value. Obviously we have only to place the first figure of each product immediately under the multiplying digit.

MULTIPLICATION BY FACTORS

If the multiplier has factors, we may, instead of using the above process, multiply by one factor, then multiply this product by another factor, and so on, till we have used all the factors.

EXAMPLE: Multiply 72486 by 147.

147 = 3 × 7 × 7.

Then

72486	
3	
217458	
7	
1522206	
7	
10655442 *Ans.*	

Suppose the several numbers to be subtracted

♦Signifies new numbers found in other tables of Charts I and II.

+Signifies old numbers having been studied in other tables of Charts I and II.

CHART II.

Thoroughly develop the idea of units, tens and hundreds columns. Again master each table separately and review as suggested by drill charts before beginning a new table.

1st.—Suggest that the 10 is made of a cipher in its units number and a 1 in its tens number. Also that the units number in the answer is a cipher, and that the 10's or 10's and 100's numbers are the same as the numbers we multiply by 10.

Remember that multiplying by 10 is the same as multiplying by 1 and adding an 0 to the units column.

This idea may be developed into rapid drills of multiplying by 10's; 100's; 1000's; etc., by adding 0's.

The 2's, 4's, and 3's can be reviewed by multiplying by 20, 40, and 30; or by 200, 400, and 300, etc., by adding 0's.

2nd.—Note that the 11 is composed of 2 ones; and that in the answer, both the units and tens columns contain the same numbers, as 11, 22, etc. The black line separates numbers not belonging to the rule $(10\times11)=(11\times10$; **only two combinations remain to be studied.

CHART III.

The six tables containing the most difficult numbers are arranged vertically instead of horizontally, so that the child may become accustomed to the difference in the position of numbers.

	3 ×1	1 3	3 2	2 3	3 3	3 4	4 3	3 5	5 3	3 6	6 3
3 7	7 3	3 8	3 8	3 9	9 3	3 10	10 3	3 11	11 3	3 12	12 3
	4 1	1 4	4 2	2 4	4 3	3 4	4 4	4 5	5 4	4 6	6 4
4 7	7 4	4 8	8 4	4 9	9 4	4 10	10 4	4 11	11 4	4 12	12 4
	6 1	1 6	6 2	2 6	6 3	3 6	6 4	4 6	6 5	5 6	6 6
6 7	7 6	6 8	8 6	6 9	9 6	6 10	10 6	6 11	11 6	6 12	12 6
	7 1	1 7	7 2	2 7	7 3	3 7	7 4	4 7	7 5	5 7	7 6
6 7	7 7	7 8	8 7	7 9	9 7	7 10	10 7	7 11	11 7	7 12	12 7
	8 1	1 8	8 2	2 8	8 3	3 8	8 4	4 8	8 5	5 8	8 6
6 8	8 7	7 8	8 8	8 9	9 8	8 10	10 8	8 11	11 8	8 12	12 8
	12 1	1 12	12 2	2 12	12 3	3 12	12 4	4 12	12 5	5 12	12 6
6 12	12 7	7 12	12 8	8 12	12 9	9 12	12 10	10 12	12 11	11 12	12 12

are equal to one another; suppose, for instance, we have to take away 3 times 10875 from 50171.

The work is written thus:

50171	Say, mentally,
10875	three 5's, 15, and 6 = 21, carry 2,
3	three 7's, 21, 23, and 4 = 27, carry 2,
17546 *Ans.*	three 8's, 24, 26, and 5 = 31, carry 3,
	three 0's, 0, 3, and 7 = 10 carry 1,
	three 1's, 3, 4, and 1 = 5.

Short Cuts in Multiplication

To multiply any number by 25, add two ciphers, and divide the number by 4.

To multiply any number by 125, add three ciphers, and divide the number by 8.

To multiply a number by any number of nines, add as many ciphers to the number as there are nines, and from this subtract the original number.

To multiply any number by $2\frac{1}{2}$, add one cipher, and divide by 4.

To multiply any number by $3\frac{1}{3}$, add one cipher, and divide by 3.

To multiply by $33\frac{1}{3}$, add two ciphers, and divide by 3.

To multiply any number by $1\frac{3}{7}$, add one cipher, and divide by 7.

To multiply by $16\frac{2}{3}$, add two ciphers, and divide by 6.

To multiply by $14\frac{2}{7}$, add two ciphers, and divide by 7.

To multiply by 875, add three ciphers, and divide by 8.

To divide by 25, multiply by 4, and cut off two figures.

To divide by 125, multiply by 8, and cuff off three figures.

To multiply by $12\frac{1}{2}$, add two ciphers, and divide by 8.

To divide by $12\frac{1}{2}$, multiply by 8, and cut off two figures.

To find the value of any number of articles at 75 cents each, say 248 yards of cloth at 75 cents a yard, deduct one-quarter of 248 from it, and call the remainder dollars. At a dollar a yard the result would be \$248; then at 75 cents it must be \$248 − (¼ of 248) = \$184.

PROOFS IN MULTIPLICATION

THE MULTIPLICATION	THE PROOF
42	25
×25	×42
210	50
84	100
1050	1050
123	475
×475	×123
615	1425
861	950
492	475
58425	58425

The proof consists merely in reversing the positions of the multiplicand and multiplier, and performing the multiplication in the usual way. If the product is the same in both cases the work is correct.

Division is the method for finding how many times one given number can be subtracted from another given number.

The first number is called the divisor, the second number is called the dividend, and the number of times the subtraction is done is called the quotient. The number which remains after the last subtraction (if any does remain) is called the remainder.

The sign ÷ written between two numbers denotes that the first is to be divided by the second.

Division is also denoted by writing the dividend above the divisor with a line between them.

Thus $28 \div 7$ and $\frac{28}{7}$ each mean that 28 is to be divided by 7.

Division may be looked upon in two ways. Suppose we have to divide 28 marbles amongst a certain number of boys. Then (1) if we are told the number of boys we can find how many marbles each will get. (2) If we are told how many marbles each boy is to have, we can find how many boys will get a share.

It is plain from the definition of division that—

divisor × quotient + remainder = dividend.

The multiplication table enables us to divide any given number by a number less than 13.

EXAMPLE 1: Divide 3729 by 7.

We have to divide 3 thousands 7 hundreds 2 tens 9 units by 7. We cannot divide the 3 by 7, since 3 is less than 7. But these 3 thousands are equal to 30 hundreds, which, with the 7, make 37 hundreds; 37 hundreds ÷ 7 gives 5 hundreds for quotient, and 2 hundreds remainder. Calling these 2 hundreds 20 tens, and adding the 2 tens of the given number, we get 22 tens to divide by 7. This gives 3 tens for quotient and 1 ten remainder. The 1 ten is 10 units, which, with the 9 units of the given number, make 19 units. 19 units ÷ 7 gives 2 units quotient, and 5 units remainder.

Thus the whole quotient consists of 5 hundreds 3 tens 2 units, *i.e.* 532, and the remainder is 5.

The work is written thus:

7)3729	Say, mentally,
532 quotient	seven 5's, 35, and 2, 37, carry 2,
+5 rem. *Ans.*	seven 3's, 21, and 1, 22, carry 1,
	seven 2's, 14, and 5, 19.

EXAMPLE 2: Divide 13,188 by 12.

	Thus:
12)13188	twelve 1's, 12, and 1, 13, carry 1
1099 quotient	twelve 0's, 0, and 11, carry 11,
	twelve 9's, 108, and 10, 118, carry 10,
	twelve 9's, 108.

The above process is called Short Division.

Division by 10, 100, etc.

Suppose we have to divide 1297 by 10. Now 1297 = 129 tens + 7. ∴ 1297 ÷ 10 = 129 quotient +7 rem. Therefore, to divide a number by 10, we have only to cut off the unit's figure, this unit's figure becoming the remainder.

Similarly, to divide by 100, we must cut off two figures. Thus, 1297 ÷ 100 = 12 quotient +97 remainder.

LONG DIVISION.—If the divisor is greater than 12, the quotient is usually found by the process known as long division.

EXAMPLE: Divide 39576 by 31.

31)39576(1276 quotient	It is usual to put the dividend between brackets, turned
85	outwards, and to write the
237	divisor in front of it. Now, 31
206	cannot be divided into 3 ten-thousands so there will be no
20 rem.	ten-thousands in the quotient. But 3 ten-thousands = 30 thousands, which, with the 9 thousands of the dividend, make 39

thousands. 31, divided into this, gives 1 thousand quotient. We write 1 (thousand) in the quotient, multiply the divisor by 1 000—*i.e.* multiply by 1, but begin writing under the thousands place of the dividend—and subtract the result from the dividend. These two operations can be done in one process, as previously shown.

The remainder is 8 (thousands). Writing the 5 (hundreds) of the dividend with the 8 (thousands) we get 85 (hundreds). 85 divided by 31 gives 2 (hundreds) for quotient. Write 2 (hundreds) in the quotient, multiply the divisor by 2 and subtract the product from 85.

The remainder is 23 (hundreds). Proceeding as before we see that 237 (tens) divided by 31 gives 7 (tens) quotient, and after multiplying the divisor by 7 and subtracting, we get 20 (tens) remainder. Bring down the 6 (units) from the dividend, making 206 (units) in all; divide by 31 which gives 6 (units) quotient, and leaves remainder 20 (units).

The complete quotient is therefore 1276, and the remainder 20.

THE THREE DIFFICULTIES IN LONG DIVISION

1. When the partial dividend contains one more figure than the divisor.

EXPLANATION: Divide the first or the first two figures on the left of the partial dividend by the left-hand figure of the divisor, and so continue.

2. When the trial quotient figure is not the true quotient figure.

EXPLANATION: (a) When the remainder is smaller that the divisor, the trial quotient figure is the true quotient figure.

(b) If the remainder is larger than the divisor, the trial quotient figure is too small.

(c) If it is impossible to subtract, because the number to be subtracted is too large, the trial quotient figure is too large.

3. When the quotient contains 0's.

EXPLANATION: Everything proceeds all right until after the first subtraction. There is no remainder. Bring down the 9 but the child sees that 48 is not contained in it even once. Tell the child to write a 0 in the quotient to show that the divisor is contained no times, and then bring down an additional figure.

If after bringing down the additional figure, the divisor still remains larger than the partial dividend, write another 0 in the quotient and bring down another figure.

PROOFS IN DIVISION

The best way to prove work in division is to multiply the quotient by the divisor and add the remainder, if there is one.

The result will equal the divid nd if the work is correct.

EXAMPLE:

Divide 600,181 by 937.

WORK	PROOF
501	640
640—	937
937	
	4480
937)600181	1920
5622	5760
3798	599680
3748	501
501	600181

SHORT-CUTS IN DIVISION

SHORT DIVISION.—When the divisor is a single figure, the quotient is written below the dividend, and the process of multiplication and subtraction performed mentally.

WORK:
6)845
140+5
Ans. $140\frac{5}{6}$

Divide 845 by 6. Say, 6 in 8, 1 time, 2 over; mentally prefix the 2 to 4, thus making 24, which contains the divisor 4 times. As 6 is not contained in 5, write a 0 in the quotient and consider the 5 as a remainder.

When the divisor is, 10, 100, 1000, etc., cut off from the right of the dividend as many figures as there are ciphers in the divisor.

Divide 3425 by 100. *Ans.* 34.25. 34 is the quotient; 25 the remainder.

When there are ciphers on the right of the divisor, cut off the ciphers from the divisor, and as many figures from the right of the dividend. Divide remaining part of the dividend by that of the divisor. Annex the figures cut off from the dividend to the remainder, for complete remainder.

At a yearly salary of $1500, how long will it take to earn $9375?

WORK:
15|00)93|75(6¼
90
375
$\frac{375}{1500}=\frac{1}{4}$.
Ans. 6¼ years.

The remainder, 3 (hundred), and the 75 cut off, form the complete remainder, or $\frac{375}{1500}$, reduced, equals ¼. The figures cut off are the complete remainder when no other.

PROPERTIES OF NUMBERS AND CANCELLATION

An Integer or Integral Number is a whole number; as 1, 7, 25, etc.

A Factor or Exact Divisor of a number will divide it without a remainder.

EXAMPLE: The factors of 9 are 3 and 3, because $3\times3=9$.

A Prime Number is one that cannot be resolved into factors.

EXAMPLES: The Prime Numbers below 50 are 1, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47.

All Prime Numbers, except 2 and 5, end with 1, 3, 7 or 9.

PRIME NUMBERS FROM 1 TO 1000
(Use This Table for Reference)

1	97	227	367	509	661	829
2	101	229	373	521	673	839
3	103	233	379	523	677	853
5	107	239	383	541	683	857
7	109	241	389	547	691	859
11	113	251	397	557	701	863
13	127	257	401	563	709	877
17	131	263	409	569	719	881
19	137	269	419	571	727	883
23	139	271	421	577	733	887
29	149	277	431	587	739	907
31	151	281	433	593	743	911
37	157	283	439	599	751	919
41	163	293	443	601	757	929
43	167	307	449	607	761	937
47	173	311	457	613	769	941
53	179	313	461	617	773	947
59	181	317	463	619	787	953
61	191	331	467	631	797	967
67	193	337	479	641	809	971
71	197	347	487	643	811	977
73	199	349	491	647	821	983
79	211	353	499	653	823	991
83	223	359	503	659	827	997
89						

A Composite Number is one that is composed of two or more factors; thus, 4 and 30 are composite numbers, because $2\times2=4$; and $2\times3\times5=30$.

A Multiple of a number will contain it without a remainder.

The Aliquot Parts of a number, are the parts by which it can be divided without a remainder; thus, $6\frac{1}{4}$, 10, $12\frac{1}{2}$, $16\frac{2}{3}$, etc., are aliquot parts of 100.

The Reciprocal of a number is the quotient arising from dividing 1 by that number; thus, the reciprocal of 2 is ½; of 8, ⅛; of 25, $\frac{1}{25}$, etc.

The Arithmetical Complement of a number is the difference between itself and the next higher decimal; thus, the arithmetical complement of 7 is 3; of 85, 15, etc.

Factoring is the process of resolving a composite number into its factors.

A Prime Factor of a number is a prime number that will exactly divide it; thus, the prime factors of 42 are 2, 3 and 7.

A Common Factor or Divisor of two or more numbers will divide each of them without a remainder; thus, 6 is a common factor of 18, 24 and 30.

Two or more numbers are prime to each other when they have no common divisor; thus 9 and 20 are prime to each other.

To find the prime factors of a composite number.

RULE.—Divide the number and each successive quotient by their least prime factors, till a quotient is found which is itself a prime number.

EXAMPLE:—Find the prime factors of 105.

WORK:

3)105
5)35
7

The least prime number that divides 105 is 3, and the least that divides 35 is 5; hence, the two divisors and 7, the last quotient, which is itself a prime number, are the prime factors of 105.

Ans. 3, 5, 7.

GREATEST COMMON DIVISOR

To find the Greatest Common Divisor of two or more numbers.

RULE.—Divide, first the numbers, then the quotients, by any common divisor. The product of the several divisors will be the greatest common divisor.

EXAMPLE: Find the greatest common divisor of 12, 30 and 54.

WORK:

2)12 30 54
3)6 15 27
2 5 9

Writing the numbers in a line we find that 2 is a common divisor of all the numbers, and 3, of all the quotients. The last quotients (2, 5 and 9) being prime to each other, proves that 2 and 3 are the only common divisors, and that 6, their product, is the greatest common divisor of 12, 30 and 54.

Ans. 6.

Another method of finding the greatest common divisor—by continued divisions.

EXAMPLE: Find the greatest common divisor of 65 and 91.

WORK:

65)91(1
65
26)65(2
52
13)26(2

RULE.—Divide the greater number by the smaller; then the divisor by the remainder, and so on, always dividing the last divisor by the last remainder, till nothing remains. The last divisor is the greatest common divisor.

Ans. 13.

THE LEAST COMMON MULTIPLE

of two or more numbers is the least number that will contain each of them without a remainder; thus, 36 is a common multiple of 2, 3, 4 and 6; while 12 is their least common multiple.

To find the least common multiple of two or more numbers.

RULE.—Write the numbers in a line, and divide by the least prime number that will exactly divide two or more of them. Write the quotients and the undivided numbers in a line below. Continue to divide in this manner till the numbers in the last line are prime to each other. The continued product of the divisors and the numbers in the last line will be the least common multiple.

EXAMPLE: Find the least common multiple of 2, 3, 4, 5, and 6.

WORK:

2)2 3 4 5 6
3)1 3 2 5 3
1 2 5 1

Writing the numbers in a line, we see that 2 will exactly divide three of them; so we write the quotients and the undivided numbers in a line below. Again, we see that 3 will divide two of the numbers in the second line. The numbers in the third line being prime to each other, we multiply them and the two divisors together; thus, $2\times3\times2\times5=60$, which is the least common multiple of 2, 3, 4, 5 and 6.

Ans. 60.

CANCELLATION

Cancellation is the striking out of factors common to dividend and divisor. It is proper whenever only the ratio of the quantities is to be considered.

If the dividend and divisor both have common factors, the work can be made much easier by cancellation.

In order to cancel, write the dividend above the divisor, with a line between.

PRINCIPLE.—Canceling like factors from both dividend and divisor does not change the quotient, but makes the work easier.

EXAMPLE:

$$18\div9=2$$

Cancelling the factor 3 from both 18 and 9, we have—

$6\div3$.

$6\div3=2$. The quotient is not changed.

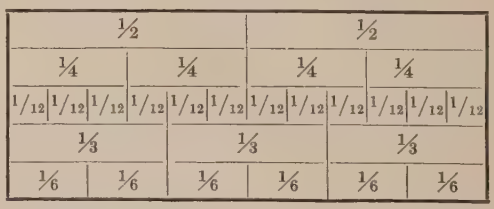
ANOTHER FORM

$$\frac{18}{9}=2$$

Cancelling the factor 3 from both 18 and 9, we have—

$$\frac{\overset{6}{\cancel{18}}}{\underset{3}{\cancel{9}}}=\frac{6}{3}=2$$

Note.—In cancellation we use the last form.



The above diagram shows the relation of the elementary fractions to one another, and from this point on the pupil should be taught to think in terms *less* than a unit.

(The more advanced treatment of arithmetic begins on page 940.)

CONDUCT AND MANNERS OF CHILDREN: To Parents and Teachers

"A king can do no wrong," it is said. You might well add, though for a different reason, "nor children either." This conception of child nature should determine, in large part, the fundamental attitude in the home.

The child may be *doing* what is *wrong;* but you should remember that he is not doing it *because* it is wrong. In the first period you should consider more especially the necessity of his forming *good habits*, for habit at this time really takes the place of *reasoning* on his part.

Difficult as such an attitude may appear, it is possible for you to acquire it in time if you strive to allow no exception to the assumption that young children are innocent, that is, that *they really do not mean to do wrong.*

In your soul there should not be one drop of anger, indignation, or condemnation.

The thought which should guide you is that children are pupils, and have to be *taught* how to conduct themselves precisely as they have to be taught with the greatest difficulty and the utmost perseverance their "lessons."

Parents should therefore display as much self-control and foresight as the teacher, for, broadly speaking, *their task and that of the teacher are identical.*

Home Atmosphere.—Assuming *affection* for your children as a matter of course, the home atmosphere should be one of happiness, joy, cheerfulness, geniality, and good temper.

Happiness acts on children as the sun acts on the vegetable kingdom. They can never have too much of it. They will grow best, learn best, behave best, if you keep them happy.

Do not argue with children about things. Let them know in a pleasant manner, as *you* already know, that habits cannot be acquired or removed by argument or exhortations. Following this principle, you say that you cannot hear when addressed in a loud voice; that "must" means "must not," and "must not" "must"; that "always" means "never," and "never" "always."

Importance of Postiveness.—An indefinite attitude on the part of parents is the cause of much mischief in home education.

Children may get so accustomed to hear you repeat and repeat a request that after a time they will find a genuine difficulty in grasping that they are being spoken to or asked something.

At the very beginning it is religiously necessary that you should pay close attention at the time of the action, and that you should frequently remind your children during the day of what is expected of them during meal-times, etc.; but this should almost wholly cease after four or five days.

Doing the wrong thing is frequently, in part or wholly, the result of ignorance. Accordingly you will naturally see that the children know, for instance, how to hold the spoon or fork, how to convey the food to the mouth, and how to bend over the plate in eating; and you will take great pains to *instruct them as to every detail*, not losing patience because they do not know what is expected of them, because they do not readily understand, or because they very easily forget.

It is, therefore, not too much to expect that for, say, three days your attention will be unstintingly given to the *habit to be acquired*, especially as the children have probably to learn to forget the way they have been accustomed to proceed. The building up of one habit usually means the removal of another.

Without such a rule, the tendency is for the children to retain an objectionable habit indefinitely, for months and even years. The "within a week" rule acts lightning-like and settles every one of your difficulties at once and once for all. Without it, also, bad habits pile on bad habits, and you have ceaselessly to exhort, to warn, and to reprove, with ever fewer chances of achieving any substantial changes, till you are driven nearly to despair.

Solve One Problem at a Time.—If you are to be successful, another kind of definiteness is essential, namely, *ask for one or a very few changes of a definite character at a time.*

To demand of children to "behave properly" in a week, or even to improve in half a dozen matters within this period, or for them to attempt things beyond a child's strength, is to invite failure and disappointment. Concentrate, therefore,

on building up one or two habits in a week, and leave other things to be dealt with later.

KEEP A SUNNY TEMPERAMENT.—Habits are readily and speedily formed, and those habits are readily and speedily loved for the ideal end which they serve. Be *thoroughly cheerful* and your children will courageously bear pain, trouble, and disappointment, and good habits and desirable qualities will grow like vegetation in the tropics. In such an atmosphere the germs of moral disease languish and die.

You should *help* your children to be good. You should bring them gradually to acknowledge that they themselves desire to be true men and women, independent of the impulses and appetites of the mere moment. You should induce them to allow you to co-operate with them in their up-building. You should typify to them the *ever-constant friend* rather than the *superior parent.*

PUNISHMENT AND REPROOF.—You may think that under a subtle disguise *punishment* has been justified in several instances in the preceding paragraphs. But if punishment implies a wrong done, a wrong-doer, and expiation, this is not the case.

Take, however, the instance of your child having done "wrong," and that exhortation is ineffective. In that case still keep your poise, and send him into a corner or up to bed "to think" about how he is to act in future, or treat him gravely, or do not speak to him for an hour or two, and the like. Treat the case as one for the *doctor*, not for the *executioner*, and you will quickly succeed.

If, on the other hand, you lose your temper, your child will lose his temper, and the effect of the correction will be virtually zero. Once more, treat your mistaken or erring child gently and thoughtfully, precisely as a gentle and thoughtful physician treats his patients. Remember the following points:

(1) A *sunny temperament* is essential.

(2) You should feel for your children and *put yourself in their place, in order to understand them and do justice to them.* It will not do for you to think that they can teach you nothing.

(3) *You should use your wits to the uttermost*, for only in this way will you be able to discover what is the best thing to be done. Take it easy, and the child will prove more than your match.

(4) *You should have a strong, inflexible, unwavering will.* When you have made up your mind on good evidence, nothing but better evidence should be able to change it. Your children will thus not expect to move you by those little ways which children employ, and they and you will be the happier for it.

(5) You should remember that refinement or respect for the individuality and sensibilities of others is as much in place in the nursery as in the drawing room.

Only if you serve in this way the good with all your heart, all your mind, all your will, all your brightness, and all your refinement, are you likely to succeed and avoid disappointments innumerable. "Enlightened fellow-feeling promptly, genially, and tactfully obeyed" should be everybody's rule of life, especially the parents'. Let this be your motto and you will not think of punishment, while the atmosphere of the home will be all that it should be.

HABITS OF ORDERLINESS.—Under regularity, or orderliness, the following habits should receive early attention:

(1) The child is to be put to bed at regular times, early, while awake, without anyone remaining with it, and without leaving a light behind in the room;

(2) it should rise at regular times, the amount of sleep being adjusted according to age;

(3) it should, health permitting, have its food and bath regularly in a regular place and in a regular manner, not playing with the food nor having food between meal-times;

(4) it should have, at least twice a day, in very nearly all weathers, outdoor exercise or outdoor air for stated periods at set times (of at least one and a half hours);

(5) by the age of two and a half it should practically eat by itself, and begin to dress and wash itself;

(6) it should not touch anything on the table, nor touch sticks, knives, forks, matches, lamps, nor any class of object not already permitted, and it should not ask for what others possess;

(7) it should always have its hands and face clean before meals, and cleanliness and tidiness should be generally encouraged;

(8) it should ask for, or use, a handkerchief;

(9) its natural wants should be, in health, satisfied at appointed and convenient intervals;

(10) it should pleasantly say "Please" and "Thank you," "Good morning" and "Good night," "How-do-you-do," and "Good-bye"; and

(11) it should gradually be brought to act on the principle: "A proper and convenient place for everything, and everything in its place."

The Desirable Habits.—You may avoid much superfluous thought during the first and following periods by discovering what things are to be respected —say, *punctuality; promptitude; gentleness; orderliness; sobriety; purity; industry; selecting desirable companions; loving learning, nature, and art; respect; self-help; plain living; and dislike of unnecessaries; thoughtfulness*—and seeing that these are followed *unhesitatingly.*

Lastly, by making in time the *doing what is right and reasonable the supreme conscious habit,* of which the other unconscious habits are expressions, all habits lost their inelasticity.

You must remember that *we can only chose between good and bad, reasonable and unreasonable, habits, not between habits and no habits.* As your children grow older you may expect that the formation of apparently separate and meaningless habits will grow into the *single habit* of wishing to *do the right generally.*

Management of the Will

Both in the earlier stages and in the later there are plenty of opportunities to practice this comprehensive and cardinal virtue. Here are some of the habits to be acquired in this connection, though great care must be taken that nothing unreasonable is demanded of the child, else we shall fail completely:

(1) A phrase like "I am sorry" might be chosen to indicate that a thing ought not to be done. This phrase is not to be repeated nor to be lightly used, and must be respected at once.

(2) Definite suggestions must be followed unhesitatingly.

(3) There must be no scolding or corporal punishment; the voice should be lowered rather than raised when ordering or disapproving.

(4) Requests and prohibitions should usually be uttered conversationally.

(5) Children should never be offered or receive rewards for doing what they ought to do—loving approval or pained disapproval, or moral approval and moral disapproval, should be the only additional incentives. Children follow advice naturally and cheerfully.

(6) Crying should never act as a reason for granting what had been rightly denied; this is imperative, for children as they grow older do not cry (except for a few moments, or when in pain) when they know that crying is useless.

(7) The words "Please wait" should be employed on equal terms with "I am sorry" and requests; but this class of request should not be abused. Many parents compel children to wait for protracted periods, and of course impatience, and not patience, is thus fostered. Similarly, children's requests should be attended to without undue delay; they should not be kept indefinitely waiting for an answer.

(8) Children must not be tempted to act rightly out of jealousy. When the child declines to accept anything, it should never be told, for instance, that if it does not accept it the cat will have it, or its brother, or someone else.

(9) *Teasing* should not be a method of inducing children to respect our wishes, nor should there be, except with trained children, an *appeal to the child's love* when obedience is in question, for love must be the normal state which is felt rather than known. *Ridicule* must be avoided, and so must *rough play* and *lack of refinement.*

(10) When the child requires something, its attention should not be diverted by, for instance, saying, "*Oh, look at the duck.*" Diversion should only be used during the period of infancy (say, up to eighteen months) or during illness, and then most sparingly, or else when the child evidently desires to have its mind changed, which is not infrequently the case.

A wise and firm parent will not be tempted and will not need to resort to any of the shifts censured in this class of habits. Unswerving firmness, assisted by careful thought and a genial temper, accomplishes with ease what many laborious shifts are powerless to perform. A glance of disapproval or expression of

disappointment is with the well-trained child or more weight than a thrashing with another which is badly brought up.

Regular good habits, a simple life, and a disciplined will make the task of both parent, teacher and child relatively light.

MORAL HABITS OF CHILDREN

The last class of habits to be acquired in early childhood are the more strictly *moral* habits. These are comparatively few in number at this stage. They are as follows:

(1) The child *should not be made vain* by an undue admiration of its dress, features, or possessions.

(2) Property should be mostly held in common and for use rather than be regarded as personal; "this is mine" is a phrase for which there should not be many occasions, while "this is hers," "this is ours," should be encouraged. At the same time it should be recognized that private property has many valuable aspects, and should not, therefore, be altogether discouraged.

(3) The child should gladly share with others.

(4) It should be courteous; "please" and "thank you," etc., to be normal expressions on its part.

(5) After the second year it should be helpful in many small things and love to attend to itself a good deal.

(6) It should suffer small pains bravely and make little of them. There should be no beating of chairs against which the child has fallen; no kissing the spot hurt (though there is little harm in this), but rather sending a kiss to the chair which caused the hurt. "Never mind," said cheerily, may be perhaps the most appropriate and most lasting soother of pain.

(7) The child should not beat others to the admiration of those present. Many children are thus drilled into slapping and kicking. They should have no experience of the kind to repeat.

(8) The child's gaze should be encouraged to be frank, its voice pleasant, its bearing firm.

(9) The child should learn with growing deliberateness to love and do the right, so far as this can be expected of a young child.

(10) It is advisable that the child should be encouraged in the active virtues by having a pet to care for, and that in this connection the virtues of gentleness and thoughtfulness should be strongly emphasized. With a cat as with a dog it is easy to determine when they are tired of play or do not relish it.

Best of all, but not to the exclusion of the other ways, is active assistance in the home, looking after personal matters, and helping brothers and sisters. Care of plants is also of a high educational value. Remember, however, that *all work and no play make Jack a dull boy.*

(11) Only what is thorough may pass.

(12) Everything should be done with care, whole-heartedly, and intelligently.

(13) The child should be prompted to be joyously cheerful and make light of small troubles. It should love to be *brave.*

(14) The idea of right should extend to all living beings with whom the child comes into contact.

As to habits in general, special difficulties are often experienced at certain critical stages—first, when about the age of two, the child begins to reason; secondly, when two or three years later, its will and power of speech develop; thirdly, when, about the age of ten, the child begins to be capable of self-directive action; and, later on, when adolescence merges into manhood or womanhood.

In the first stage, as in the second and third, patience and persistence are required to attach the child to reasonable habits, for in both cases it is only a question of tiding over a transitional period.

At the same time, just because we have to deal with a turning point, we must not be over-insistent; we must allow sometimes that we are mistaken or that the child is stronger than we are; we must trust, to some extent, to time; we must conquer by intelligence rather than by a measuring of wills; and we must also consider how far?

OBEDIENCE

Obedience means no more than suggesting to a child something which we desire it to agree to, and in ideal cases this is the relation between parent and child.

The baby knows no rules. It seeks only what seems pleasant to itself. It is kept only by force from doing what would be harmful to itself, or to the persons and things about it.

Soon, however, in the case of a child properly trained, the rules begin, and it never is free of them again so long as it lives.

The first lesson that the child has to learn is the general one of obedience. *It must learn to obey,* for this lies behind and beneath all other lessons.

In this the training of a child is like the training of a dog or a horse. When the animal has learned what it is *to mind* it can learn a great many other things.

This does not mean that the child must have hard and harsh rules. The best obedience is learned quietly and pleasantly, and almost without the sense of constraint. Even a dog is best trained in this way, and then it thoroughly enjoys performing its tricks.

As the child grows older, the problem of obedience changes.

You may have been surprised at being told that it is manly to obey, and that men and women have to do this. At school the scholar has to mind the teacher, and the teacher seems only to command. But the teacher has to obey as truly as the scholar. What would you think if, when you went to school, you should find that the teacher had gone off for a day's pleasuring in the woods? You might like it, but what would your parents or the committee think? What would they think if the teacher did not hear your lessons, and did not see that you learned them? Thus you see that the teacher has to obey as well as the scholar.

Fine characters are moulded chiefly through obedience in early life.

TRUTHFULNESS

Perhaps the first serious danger you will meet with in older children is that of possible untruthfulness.

Hitherto your children's minds were not developed enough to speak or act a lie; but now matters are different. Both in speech and in action your children become capable of untruthfulness in this period, and perhaps the greater danger is untruthfulness in speech. Here the starting-point is in many cases natural, since toward the beginning of this period children are usually ready to utter whatever sentence their imagination constructs.

When the child has offended, and it is interrogated as to its guilt, it at first gives indiscriminate answers; at a later stage, more especially when harsh treatment is probable, it may find that telling an untruth is convenient, and in this way proceeds on the slippery road. In most cases the process is apparent: the child, for instance, invariable and parrot-like, says that its brother did it. Supreme caution is, therefore, required here.

As we have seen, occasions for untruthfulness should be of themselves rare when the child is orderly, simple in its tastes, ready to respond, and eager to help. You should further discourage incorrect statements by

(1) correcting them as amusing slips or errors;

(2) not putting doubtful questions;

(3) ignoring what is flippantly said; and

(4) never speaking about lies and lying or falsehoods.

"You are making a mistake," "Try to look or remember more carefully," said in a highly amused tone, should be your normal comment to some exaggerated or slipshod statement. If you act intelligently, your children will soon come to think truthfully and be truthful.

EXAMPLE AND PRECEPT

Children, you doubtless know, are imitative, though you may not have noticed that they not only imitate your actions but your attitudes and feelings. It is important to recognize this, since by such imitation your children enter, for better or worse, into the whole spiritual heritage of mankind. By assuming a certain bodily attitude, we suggest the feelings appropriate to it, and if you watch your young children you will find that in this manner they enter into our ways of being gentle, angry, afraid, or affectionate, and that in the same way they imitate the weakness, waywardness, or strength of our will and thought.

Consequently it is of the utmost importance that *the tone of voice, words, gestures, look, step, bearing, and movements* should as closely as possible approach perfection.

THE ADOLESCENT PERIOD

There are some virtues which are best emphasized at this period:

A very important one is that of *unhesitatingly doing what one believes to be right and reasonable.* Most tempta-

tions would be shut out if the young were determined to consider the reasonableness of a certain class of temptation only after the temptation is overcome.

This means that the young are to decide on what general courses of conduct are right to follow, and never question these when the time for action arrives.

The leading virtue of this Period is *Truthfulness*, which, being interpreted, means "full of the love of truth."

If this virtue distinguishes your children:

(1) they will hide nothing from you;

(2) they will be guilty of no mean or low action;

(3) they will avoid evil companionship;

(4) they will take part in no intrigue; and

(5) they will be honest with themselves and honest towards others.

Their relations with their fellows will at least be blameless so far as deceit of any type is in question, whether towards parents, friends, or those of the opposite sex.

And we can have no doubt that the other master virtues of the period are *love of purity, of sobriety, of work, of worthy companions.*

Perfect purity in thought, word, and deed; complete sobriety, that is, total abstinence from all intoxicating liquors; hearty love of work, that is, learning at school and choosing and following a profession enthusiastically; and good companions, that is, companionship which both satisfies and ennobles—are sure to be the gainers by *truthfulness.*

Parental Confidence.—A neighboring virtue is that of *trustfulness towards parents.* This latter virtue is of critical importance during adolescence. Let your adolescent child never embark on anything grave without consulting you, and you have a means of assisting sexual purity far greater than any indirect methods could offer. A truthful and trustful adolescent will be chivalrous, and scorn anything that requires an untruth or needs to be hidden from you.

As your children approach to *manhood* and *womanhood*—the flower of the virtues —*refinement*, must reveal itself in its full beauty—subtle insight into the needs, ideas, and feelings of others, and delicate sympathy with others' states of mind.

The Adolescent Problem.—The following outline for the consideration of parents may prove useful:

1. *The Problem:* consider carefully the whole meaning of adolescence and of marriage in its various aspects.

2. *Habits to be generally promoted:* simple and hygienic living, daily cold baths, abstinence from stimulants, sufficient exercise, hard work but not overwork, respect for self and others, sound and not too much sleep, not too soft a bed, rising instantly on waking, not drinking in the evening, etc.

3. If the adolescent teaching is *to be effective it must form part of a general system of moral teaching*, for then the force of the whole teaching can be brought to bear on the subject. In this way the adolescence problem is indirectly solved and settled.

(*a*) Take care, from the earliest period, that the child knows the devotion of the parents to each other and to their children—the common cares and joys—mother managing the household and father earning the money for the household; nobility and responsibility of married life; the parents as ideal and permanent companions; marriage not to be lightly undertaken; the nome as the unit of the State. The central thought in this teaching from about the time of puberty to the approach of manhood must be a high conception of courtship and marriage, thus minimizing the merely physical aspect, and identifying the satisfaction of the race instinct with the preservation of the race through the married state.

(*b*) As early as possible answer the child's questions about child-bearing and birth, its pains and joys;

(*c*) Prepare for (*b*) and (*d*) by a study of botany and some physiology.

(*d*) Stage of Adolescence: Explain the general unrest as due to physiological changes; explain that these will end in manhood, inclusive probably of marriage; point to the manliness of self-control; the general impulsiveness of this period to be understood and controlled; self-control in the light of the full meaning of marriage; self-control as essential to the healthy and proper growth of the adolescent; this control not harmful to adults, and practiced often in married life; bringing a pure and healthy body

to one's partner in marriage; what the adolescent, in thinking of his own married life, would like his children to be in matters of purity; the effects of being in the grip of a vile habit; the race instinct to be evidently satisfied only in the married state when parents feel that they ought to have children or when in that state no harm is done; evil companions and habits are an insult to our parents and to our ideal of marriage. Develop these ideas as the adolescent grows to manhood.

(*e*) Prostitution in the light of the whole meaning of marriage: its support is unmanly, below the conduct of a great many animals; argues a weak character; to give way to instincts is no sign of nobility; drags our whole moral nature into the mud; is an insult to our mothers and sisters.

4. The physical aspect of marriage is but a very small portion of the whole of marriage; therefore give it no special prominence.

The above outline is drawn up for the purpose of protecting and promoting *personal purity*, which is not usually sufficiently emphasized, and it *applies equally to girls and boys.*

5. *The parents should be the most intimate friends of their children, and their children should always consult them, and them alone, about the most intimate matters.*

Two final virtues round up the scheme of moral education for children. The natural love of strenuousness in childhood and youth should take form in the *desire for earning one's own livelihood* and acting in our vocations honestly and efficiently, while the love of being helpful should blossom forth at the end of the period in *an intelligent and devoted citizenship, which has for its ultimate object the harmony and advance of the human race.*

CHILDREN'S MANNERS

THEIR SPEECH.—Good manners, as well as charity, should begin at home; and even in the nursery. Boys and girls cannot be too early taught not to contradict one another, but in expressing any difference of opinion to begin with some polite phrase, as, *I beg your pardon, but,* or, *I think you are wrong,* etc. None but an untrained child will venture to correct or gainsay an elder even in this courteous fashion unless asked to give his or her knowledge or opinion of the matter under discussion.

In the presence of strangers or older persons, a polite little man or maid would forbear to speak until an opportunity was offered by a pause, or to assist in the conversation unless asked to do so. *Yes, no, I thank you, I am not sure, perhaps, I hope so,* as answers to questions, are eminently proper when a child speaks to one of its own age. For older persons, *Yes, ma'am,* and *No, sir,* imply the respect exacted from and paid by a servant to his or her employer.

For children the need of deference due their seniors is amply, and in well-bred families invariably, expressed by affixing to the reply the name or title of the person addressed, thus: *Yes, mother; No, papa; Thank you, Aunt Mary; I am not sure, Mrs. Brown; I hope so, Doctor Jones.*

GREETING FRIENDS AND STRANGERS.—On introduction to an older person, recognition should come first from the adult, as well as the offer to kiss or shake hands. *How do you do, Mrs. Brown;* or *Good morning, Mr. Jones,* is sufficient expression of greeting from the young person; and he further displays good taste and modesty by permitting the lady or gentleman addressed to begin the conversation and to end it.

On entering a room where her mother is entertaining a guest, a little girl stands beside the mother's chair until an introduction is made; and if a favor or question is to be asked, she should politely request permission to ask it; and she should remember to give the caller a polite good-day on retiring.

A boy would observe exactly the same rule. And in the street, when walking with his parents or sisters, he should lift his cap when they answer a bow or meet a friend. A boy can hardly learn too early that he should stand when the ladies enter a room, and open the door for his mother and older sisters.

THE SHY OR UNTRAINED CHILD

A shy child or an impertinently forward one should not be corrected in public by the parent who is too indifferent to strive for reformation of his or her shortcomings in private. An untrained child will contradict its mother promptly and impertinently abroad, if

allowed to do so at home; it will openly stare or laugh at an unhappy deformity, frankly comment on a visitor's loss of an arm or redness of nose, and will accept remonstrance with bad grace, if only in the presence of strangers any restraint is put upon its often innocent or unkind observations.

There is really no difficulty at all presented by the condition so often miscalled "shyness" in a child. Few children are naturally shy. Self-consciousness, an excess of vanity, a sullen humor, or a timidity engendered by a genuine unhappy ignorance of what to do, are too often the true causes of the ill behavior for which mothers too readily offer excuses. No well-mannered child is ever too shy to speak when spoken to or to play its modest little social role.

Now and then a boy or girl of a nervous temperament and lacking wholly in self-confidence betrays a case of shyness pure and simple. This a sensible mother can do much to overcome by herself rehearsing with the youngster many forms of entering a room, answering kind greetings, etc.

Children's Entertainments.—The afternoon nursery party has its duties, self-sacrifices, pretty courtesies and demands upon juvenile tact, no less than the more splendid social affairs. Even in the playground it is important for the youthful host and hostess to understand the obligation resting on them to sacrifice their own pleasure for that of any guest and play those games the visitor prefers; and on the occasion of a birthday dance or more elaborate celebration, it is not correct for the entertainers to be the most elegantly dressed of the merry-makers.

Childrens' Invitation.—On small, prettily decorated note sheets or cards, invitations to a child's party may be written, under the mother's guidance, by her children, and either posted or delivered by hand. Engraved invitations are not to be recommended for children's entertainments.

Children on being invited to a party must answer their invitations promptly, writing the replies themselves, either in the third or first person, according as the bidding to the festivity was worded.

Time and Arrangement for Parties.—From four to seven o'clock is the proper time for holding a dance for young children; and from seven to ten or eleven, for those under sixteen and over ten years of age.

A piano or a piano and harp will provide all the necessary music. Flowers may be used in abundance; and ices, cakes, fruits, salads and sandwiches are served from the dining-room table as a buffet. A bowl of lemonade stands constantly ready by the parlor door, and dance programmes are provided.

In summer, an afternoon entertainment is best held out on the lawn, and as twilight comes on, paper lanterns used. Some older person should aid the children in receiving the little people, and impress on the small host or hostess that the most important duty of the occasion is to see that the guests have a good time; that in the diversions there is no injustice done; that no girl or boy is overlooked during the dancing; and that everybody is served at the table.

Children House Guests.—Should a child be entertaining a guest when invited to a merry-making, he or she is privileged to write to, or call at once on, the giver of the dance or picnic to ask permission to bring the visitor along. And when arriving for the entertainment, he or she introduces the friend or relative to the matron of the occasion by simply saying: *Mrs. Brown, here is Mary Sherman, whom you were so kind as to say I might bring.*

Birthdays.—If the party is in honor of a birthday, congratulations, in the form: *I wish you many happy returns of the day*, are in order from the guests to the young host or hostess. On preparing to leave, every child should seek out the mistress of the house first, and say with a bow: *Mrs. Brown, I have enjoyed the dance very much and have come to bid you good evening, or Good night, Mrs. Brown. I thank you many times for my delightful evening.* Unless Mrs. Brown offers her hand or a kiss to her little guest, the bow and polite farewell are enough. With the younger host or hostess less formality is necessary, but it is requisite to seek him or her out and say cordially, *Good-bye, Bob [or Mary] I have had a very pleasant time indeed.*

Children's Playmates.—A most important branch of etiquette for a mother to study is that which has to do with the

pleasure, comfort and protection of her children.

It is a species of nursery and back-yard diplomacy that children themselves don't understand, and of which the average woman is only too ignorant; but it has everything to do with maintaining her her own station and good name in her neighborhood, or town, or street. Its first mission is to regulate and control the children's list of visiting and playing acquaintances, for small boys and girls are scarcely expected to show much discretion in their choice of friends.

When neighboring children conceive a liking for one another and their parents are unacquainted, the latter should be at pains to learn something of the home influence and surrounding of the companions of their boys and girls. If in such a case a party is in contemplation, and the son or daughter of Mrs. B. wished to extend an invitation to the children of Mrs. A., it is safest and most polite for Mrs. B. to write a courteous note to Mrs. A. seconding the invitation offered by her child. If Mrs. A. responds cordially, nothing more is needed to assure Mrs. B. that the youthful guests come to her house with full parental consent.

Undesirable Playmates.—Not infrequently a woman finds that the children of some friend of hers are spoiled, vicious, or vulgar, and therefore impossible playmates for her own well-reared children. Then the heroism of a good mother exhibits itself. She cannot in justice exclude the children of her friend from her house and acquaintance unless the friend goes too; but it is better to lose many friends than to expose the pliable, easily swayed young minds of her boys and girls to a single evil influence.

The Tactless Child.—When an entirely acceptable but tactless little boy or girl becomes too frequent a visitor at a neighbor's house, or fails from a lack of sensibility or training to know when to call and when to take leave, a rather difficult duty devolves on the mistress of the house. Shall she tell the too persistent young visitor that it is late and suggest his returning home, or meet him at the door and deny his company to that of her boys and girls? If she is a wise woman, neither of these courses will be followed.

The proper method for her when a boy visitor appears too often, is to send her own son forth with the perfectly polite request that the caller excuse him as he has tasks or errands to perform for his mother. She should be sure, though, that her son's excuse is a genuine one, and that his apologies are made kindly.

In the event of a child visitor lingering too long in the evening or at meal time, she can very properly say that she fears the young caller has forgotten that his mother may be anxious and that for that reason she may not allow her children to ask him to stop for dinner or to spend the night.

INDEX

The intelligent use of an *index* requires careful thought and practice upon the part of the reader or consulter. Many books are *over*-indexed, and trifling *allusions*, or even *words*, made to swell the index. It is obvious, therefore, that a book of moderate compass should use only sufficient space to reveal the *important general* subjects treated. Besides the general index, the following *self-indexing* dictionaries and departments should be consulted:
